INDEX TO VOLUME XLIII.

Acetylene in domestic use, Exhibition of June 22, p 35
is made, How, Feb. 16, p 29
Accuracy, Jan. 19, p 33
Adams coffee pot, Juue 29, p 43
Aero water still, Juue 29, p 39
Air blast apparatus, Mar. 30, p 39
oven and broiler burner, Patent, Feb. 23, p 42
bound service, Mar. 23, p 33
supply, Iusufficient, Feb. 9, p 35
tight waste trap, Mar. 16, p 44
Weight of, Jan. 19, p 34
Alaska stove door haudles, New, Jan. 12, p 50
Alleutown, Pa., plumbers, Feb. 23, p 32
Allowance for iron pipe, Mar. 23, p 32
Alphabetical list brands American tin and terne plates, Jan. 5, p 43
Aluminum alloys, Resistance to corrosion of some light, Jan. 19, p 54
coffee pot, Erie cast, May 25, p 41
egg cookers, Pure, Juue 29, p 40
Experiments with, May 11, p 33
Hardening of, Mar. 23, p 42
Soldering, June 15, p 31; 22, p 29
Some new uses of, June 15, p 56
Amendments to constitution, May 18, p 31
American industrial union, May 4, p 27
kitchens, Some, Mar. 9, p 29
tin plate lists, Our, Jan. 5, p 29
Angle lamp, June 8, p 40
Anti-freezing mortar, Feb. 16, p 31; Mar. 2, p 33
Apartment house fires, Apr 20, p 33
Apparatus, Air-blast, Mar. 30, p 39
Applicatiou of Acetylene, Feb. 16, p 29
Apportioning radiation, June 1, p 36
Apprenticeship, Feb. 9, p 48
code, Chicago, Mar. 9, p 45
Aqua retort heater, June 29, p 48
Arcade mop holder, May 4, p 41
Are gravel roofs durable? Feb. 16, p 31; Mar. 2, p 32; 23, p 35; 30, p 32
Argon, May 18, p 49
Armstrong pipe threading and cutting-off machine No. 2½, Jan. 12, p 36
Arrangement of hardware store, Mar. 9, p 32
Art for the artisan, June 1, p 23
of display, Feb. 9, p 39
Artesian well pressure, Utilizing, Feb. 16, p 30
Artist-artisan institute, May 11, p 25
Asbestos paper, Paste for, Mar. 2, p 32; 16, p 37; Apr. 6, p 32; 20, p 36
torch, June 1, p 39
Ash bag system in New York city, Apr. 27, p 33
Asphalt floors, June 29, p 33
Association news, Feb. 23, p 33; Mar. 2, p 41
Associations, New, Jan. 5, p 39
Atlanta Exposition, June 1, p 35
Australia, Manual iustruction in, May 4, p 39
Automatic damper regulator, Mar. 16, p 35
expansion tank, Jan. 12, p 37
B. & W. skate sharpener, Jan. 12, p 48
Babette seat, Feb. 9, p 48
Badge, New York trade school, Apr. 13, p 38
Baird snow guard, Feb. 23, p 39
tilting tumbliug barrel, Feb. 2, p 43
Baking pan, Round loaf, Jan. 12, p 47
Ball cock, Bostou safety, Jan. 26, p 47
Barker's chimney top aud ventilator, Feb. 9, p 35
Barn, Ventilating, Mar. 16, p 34
Barrel, Baird, tilting tumbling, Feb. 2, p 43
Bartlett's thermograph, Apr. 27, p 54
Base burning stoves, Jan. 12, p 40
Basin Clamp, Sherman's, Mar. 16, p 50
waste and plug, Hale, Feb. 9, p 50
Bath and lavatory, Golden crowu combination, May 25, p 32
fixture, Morrison's, June 22, p 33
heater, Little wonder gas, Apr. 13, p 43
Universal, Apr. 13, p 44
Puritau, Jan. 26, p 46
Bathroom, Pompeiian, Jan. 19, p 33
Bathtub, Copper. Feb. 16, p 34
Hardwood, Mar. 16, p 49
Battery for electric door opener, May 4, p 28
Bell trouble, Electric, Feb. 16, p 30
Belmont water closet with seat attachment, June 22, p 30
Benefits from organization, Jan. 19, p 37
Bennett's hardware shelf box, Apr. 20, p 47
Berger Bros., Mar. 23, p 48
gutter hangers, June 1, p 30
Mfg. Company, May 18, p 34
Best way to calk joints, Apr. 13, p 43
Beveling elbow, Pattern for, Apr. 6, p 45
Bids on heating, Feb. 2, p 33
Bigley's patent hot water heater, Apr. 13, p 37
Bind *The Metal Worker*, How to, Mar. 16, p 35
Bishop's ceiling plate, Apr. 6, p 41
Black iron tinning, June 29, p 32
plate mills, Mar. 9, p 42
sheet imports, Tin plate and, Apr. 6, p 37
Bliss deep throat power press, Mar. 16, p 53
Blow at eight-hour laws, Mar. 23, p 27
Blower specificatious, Mar. 2, p 36
Blue prints, Making, May 11, p 26
Boat builder's steam box, Jan. 26, p 35
Boiler, How to make, Apr. 6, p 33
Ideal steam, Apr. 20, p 44
Invincible, Apr. 6, p 40
Mahony vertical sectiou steam or water, Mar. 2, p 36
maker's bending rolls, June 8, p 36
Mending, Mar. 30, p 32
Pompeiian, Feb. 9, p 43
siphons, Mar. 30, p 34
United States, Feb. 23, p 36
Boilers, New Englaud aud excelsior coil, May 25, p 31
Boomerang, June 1, p 37
Born Steel & Range Mfg. Company, May 11, p 50
Boston safety ball cock, Jan. 26, p 47
Bottom tuyere, Feb. 2, p 52
Boxing and cartage, Charge for, Apr. 13, p 36
Brake, Range and safe makers open end hand, May 25, p 40
Bramhall Deane Company, June 29, p 49
Brand Stove Company, June 29, p 48
Brand's catalogues, Mar. 16, p 55
Brass, Brazing cast, Jan. 26, p 34
Coloring, Feb. 23, p 31
lists, Recent revisions in, Jan. 5, p 57
Bray pipe hanger, May 11, p 31
Braziug, May 25, p 26
cast brass, Jan. 26, p 34
Bread knife, Christy, model No. 16, May 4, p 41
Brightening future, Jau. 12, p 31
British tiu plate exports in 1894, Jau. 26, p 50
plates in 1894, Jan. 19, p 48
Brown's tea and coffee urn, Feb. 9, p 38
water still, Feb. 16, p 42
Bryant's lightning mixer and egg beater, June 29, p 42
Building contracts, Sub-letting in, Mar. 16, p 45
Evolution of an old, Feb. 9, p 36
operations in 1894, Feb. 2, p 48
trades exhibitiou, Feb. 2, p 33
Burner for cook stove or range, Gasoliue, Feb. 23, p 31
Improved B. & H., June 22, p 47
King Grip, May 4, p 41
New oil, Feb. 23, p 46
Patent air blast oven and broiler, Feb. 23, p 42
Business mortality iu 1894, Jan. 5, p 29
Buyer, Educate the, Apr. 6, p 31
Buzzacott's camp cooking outfit, June 22, p 45
California ordinance, May 25, p 32
stoves, Jan. 19, p 50
Calk joints, Best way to, Apr. 13, p 43; May 4, p 39
Camp cooking outfit, Buzzacott's, June 22, p 45
equipments, Folding, Apr. 20, p 35; 27, p 34
Can boss to fit around faucet, Patterns for, June 8, p 30
opener and cover, Eclipse, Jan. 12, p 47
carpet tacks, Apr. 13, p 47
openers, New, Feb. 2, p 50
top wanted, Feb 16, p 31
Canadiau customs decisions, May 4, p 49
nickel mines, June 22, p 50
steam heating, Apr. 6, p 42
Canners and tinners, Feb. 2, p 46
Capital and confideuce, Mar. 23, p 51
Carpet tacks, Can opener, Apr. 13, p 47
Carton boilers, Mar. 16, p 38
Cast iron, Soldering with, May 25, p 33
or vitrified pipe, May 4, p 34
Casting statuettes, June 8, p 29; 22, p 28
Ceiliug panel plate with enriched ceuter, Jan. 19, p 46
plate, Bishop's, Apr. 6, p 41
Columbia, Jau. 12, p 37
Sheet metal, Apr. 13, p 41
Ceilings, Sheet metal, Apr. 20, p 48
Cement for marble and basins, Wauts, Mar. 9, p 30; 23, p 32; Apr. 13, p 33
Central Stamping Company, May 18, p 42
supply association, Mar. 16, p 49
Cesspool, Well and, Apr. 13, p 33
Champion roaster or oven, Mar. 23, p 43
steel range, June 8, p 41
tin scrap, bailing press, May 4, p 30
water heater, Apr. 27, p 38

Changes in list prices granite ironware, Jan. 12, p 54
Charge for boxing and cartage, Apr. 13, p 38
Chautauqua eave trough hanger, Apr. 6, p 48
Check valve on boiler supply, June 1, p 24
Chicago apprenticeship code, Mar. 9, p 45
drainage canal, Feb. 9, p 52
stove trade, Feb. 16, p 47; May 25, p 43
Chimney heat, Economizing, June 29, p 32
top and ventilator, Barker's, Feb. 9, p 35
sweats, Feb. 9, p 35
Chimneys, Feb. 23, p 29
of large buildings, Sweeping, May 25, p 28
Choked water backs, Jan. 12, p 40
Christy model No. 16, bread knife, May 4, p 41
Church heating plants, Mar. 30, p 31
Cider press, Davidson's electric, Jan. 12, p 48
Circle, Squaring the, Jan. 19, p 34; Feb. 2 p 34
Circuit hot water job, Mar. 16, p 40
system of hot water heating, Jan. 12, p 36, Mar. 23, p 37; Apr. 13, p 36
Circulate? Will it, Jan. 26, p 34; Feb. 23, p 31; Mar. 16, p 34
Circulation, Pressure and, Feb. 2, p 35
Cistern or wells, Iron platforms for, Mar. 23. p 43
water, Purifying, Feb. 2, p 34; 16, p 31
City farming, May 4, p 27; 11, p 26
Clamp and testing cover, S. & G., Jan. 26, p 46
Clark Stove Company, Feb. 2, p 53
Clarke's instantaneous water heater, Mar. 2, p 41
Class, Lead burning, Jan. 12, p 33
Cleaning solder, Mar. 30, p 36
zinc, Feb. 16, p 31
Cleats for tin roof, Apr. 20, p 36
Cleveland Co-operative Stove Company, June 22, p 48
Close trade school season, Apr. 6, p 31

APOLLO BEST BLOOM

is the brand of galvanized iron that is true to gauge, flat (does not buckle), and is uniformly workable (bends without weakening).

GALVANIZED IRON

A first-class worker in galvanized iron knows, to his cost, the difficulties, in exacting work, imposed by refractory metal and sheets not flat, and the losses incurred through varying thickness.

EVERY SHEET GUARANTEED

The extra cost is too small to appear in small sales. The actual cost of his job to the worker is less, if well done

Facts of Interest to the Public.

Our "PROCESS" for 1895, we can say unqualifiedly, is the

MOST PERFECT WORKING

PROCESS STOVE EVER PLACED ON THE MARKET, and HAS NO EQUAL.

In calling attention to our

NEW GEM STOVE,

We offer the trade a STOVE FOR THE PEOPLE and FOR THE TIMES.

THE GEM STOVE is CONVENIENT

in SIZE, with the same sized flame as the PROCESS doing the same amount of work with **less fuel,** and at an original cost of only about ONE-HALF that of the regular high Stoves. This Stove is ABSOLUTELY our own, and CAN BE MADE ONLY BY US, and as pioneers in this business, the public naturally look to us for progress, while some of our competitors, who can only make the old line, call such improvements, "an innovation." Our GEM and PROCESS, together with our DELIGHT, celebrated JUNIORS, Individual and Single Generator Burner Stoves, &c., will give our trade a decided advantage over their competitors.

Write for Catalogue, 1895.

DEALERS!

All Weak Points About Vapor Stoves

are not called to your attention by unscrupulous manufacturers or their salesmen. They often palm off imperfect and faulty stoves as perfect, and jolly you into the belief that you have struck a bargain.

But when summer comes and truth comes to light, as it invariably does in the vapor stove business, vexation and disappointment come with it. Vexation, because you have been duped, disappointment, on account of the loss of a season's profit.

Better handle a *good line* at a fair profit than a *poor* line at a *bargain* profit. There is no such thing as a "bargain," especially in the vapor stove business. *Proof*—Review the past???

Better buy from a responsible manufacturer or his legitimate jobber, especially of one whose integrity is unquestioned, and one whose knowledge of the vapor stove business secures you an honest deal and prevents the imposition of fakes or shoddy goods. *There are a few of us left.*

Better buy a good line to be successful. A *bad* stove is a very poor purchase at *any* price.

Better look for Protection.

Protection in order to be of service to you must begin at home. See that this point is not overlooked when casting about for a line for 1895.

Better think this over.

The old adage reads, "Make Haste *Slowly*." This is a weighty proverb. The more so when you consider that the best versed manufacturers in the vapor stove industry are not offering any new inventions or innovations for the coming season.

Yours respectfully,

A. J. LINDEMANN & HOVERSON CO., Milwaukee, Wis.

"GOVERNOR" GASOLINE STOVES "PRINCESS"

We beg to announce to the Trade that we are now ready for the market with a most complete line of

SINGLE VALVE, DOUBLE VALVE AND SINGLE GENERATOR GASOLINE STOVES.

This being our first season in the business we have spared neither money nor labor to produce an article SUPERIOR to anything in the market for the same money.

Our Junior tops are 2 inches longer and 4 inches wider than those of other manufacturers. Our burner produces a steel-blue and more powerful flame than any other burner; cooking is done in 1-3 less time (with same amount of fuel) than any other Gasoline Stove can do it.

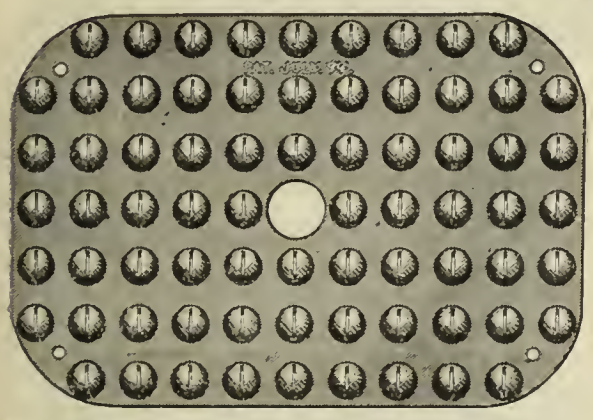
THIS IS ACCOMPLISHED BY MOST PERFECT COMBUSTION.

Our tank consists of two separate cans. The inside can contains the Gasoline and is provided with a vent which prevents the can from floating.

To fill our tank, simply remove cover from outside tank, lift out can, take to shed for filling and set it back again in tank. An automatic valve closes the bottom of the can.

This method of filling is far superior to all lay-down or removable tanks, and it makes

EXPLOSIONS IMPOSSIBLE.



Our illustrated catalogue is now ready (it contains 44 cuts) and will be sent on application.

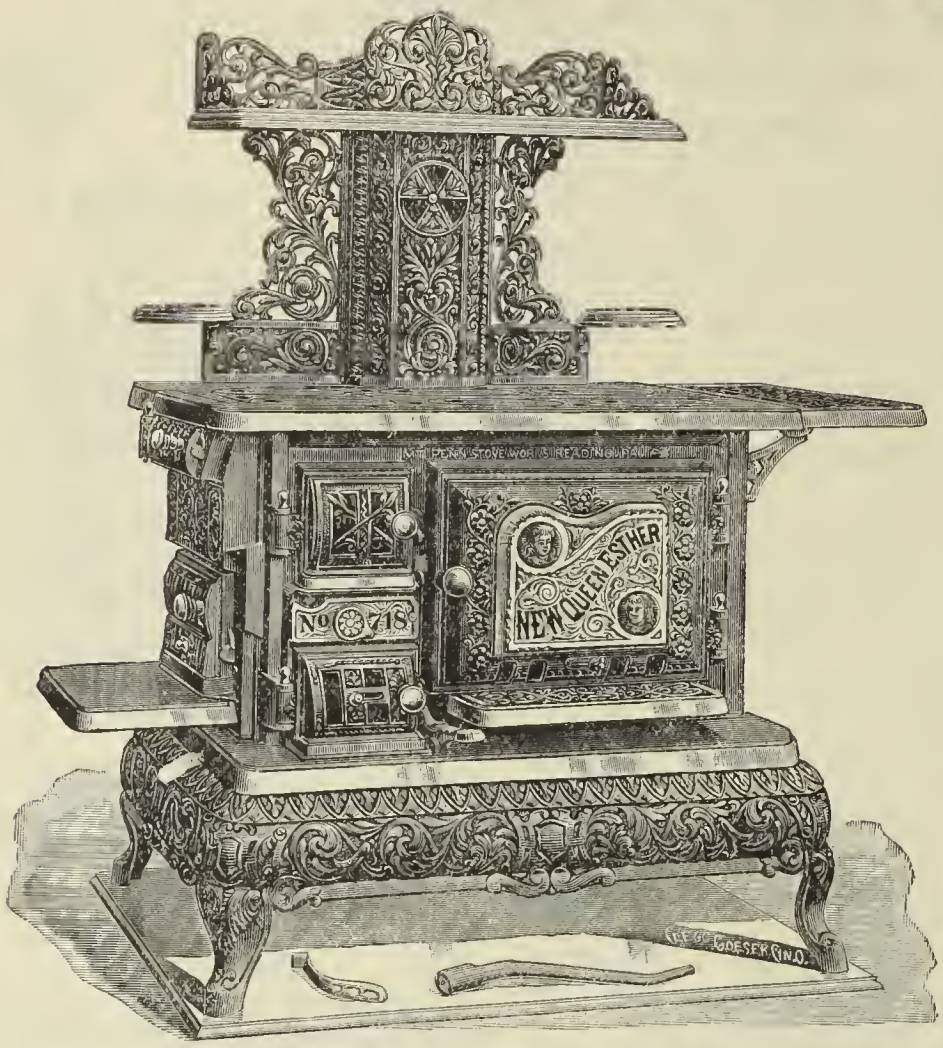
HOW TO REDUCE NATURAL GAS BILLS.

THE "PITTSBURG" GAS STOVE DOES IT.

Pronounced by Experts and Users to be the Cheapest, Best and Most Economical Gas Stove in the market. The secret of its success is not only in burning the gas perfectly, but in preventing any of the poisonous gases (the waste product of combustion) from escaping into the room, and yet extracting all the heat from the gas. **No waste heat passes into the chimney, but only the waste product of combustion.**



By making slight changes in burner this stove can be used for Artificial Gas also. If wanted for such purpose, please order "for Artificial Gas."

Full information cheerfully furnished. Manufactured exclusively and **for jobbing trade only,** by

DIXON-WOODS COMPANY, - Pittsburg, Pa.

OUR NEW QUEEN ESTHER

MT. PENN STOVES & RANGES

A Range embodying so many points of excellence as to carry its own recommendation to the thrifty housekeeper. Here are some of them:

Tin lined oven doors.
Patent pedal oven door opener.
Large broiling or feeder door.

Manufacturers and Importers of Grates, Open Fire Places, Fenders, Fire Irons, Andirons, Tiles, &c.

Office and showrooms, 246 Front Street, within three minutes of Fulton Ferry. Factory, 268 Water Street, New York.

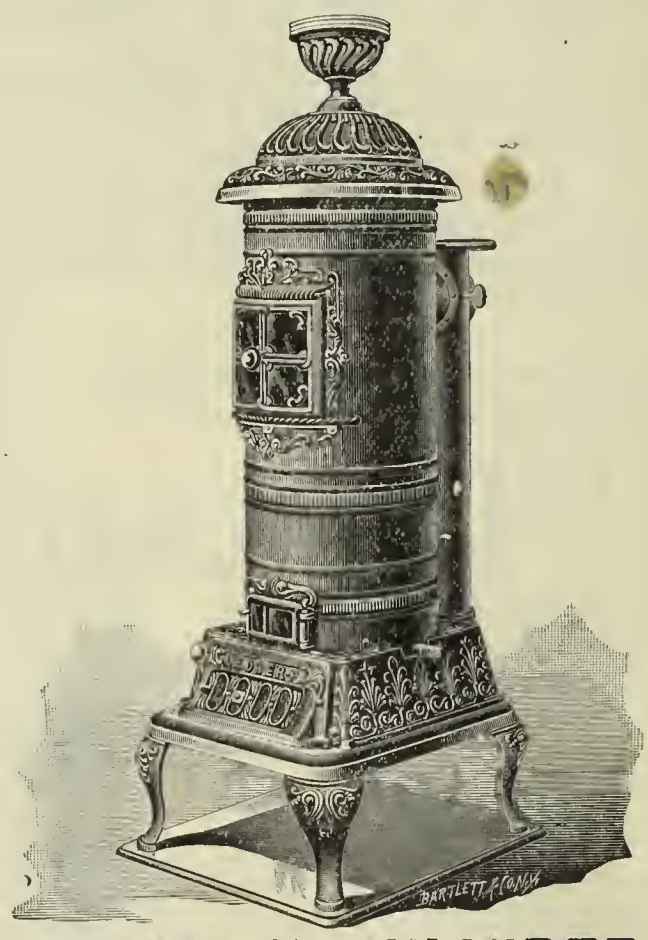
— A DIVERTER.—Harry: "Some women do have a remarkable faculty for invention."

Will: "For instance?"

Harry: "The wife of a friend of mine has patented what she calls a 'snore diverter.' It is composed of a hood and a section of flexible pipe. When her husband's snores grow unbearable the hood is lowered over his head and the snore is conducted into the cellar."

Will: "What then?"

Harry: "There hasn't a rat been seen in the house since the diverter was used."—*Pittsburgh Bulletin.*



— AN IMPRESSION.—The reed bird, delicate and delicious, lay supine on a bit of toast when Uncle Caleb from New Jersey sat down.

"Are you fond of the little fowl?" asked the hostess.

"Well," he replied, "ez fur taste, they're fine. But ez for 'pearance, I must say they 'mind me of a mosquiter growed up."—*Washington Star.*

— Mrs. Culture of Boston had been making inquiries about the healthfulness of the place.

"No," replied the summer boarding house keeper, snappishly, "no, we ain't got no typhoid germs, and there hain't been no calls for 'em either. Folks is wanting everything nowadays, and ain't satisfied with clean beds and plenty of what's good to eat."—*Texas Siftings.*

LEDGER F CYLINDER.

WITH REVERTIBLE FLUE. No. 9, No. 10, No. 12, No. 14.

Well made, attractive in appearance and attractive in price. Made both as a plain cylinder and with revertible flue as above. Circulars and prices are worth seeing. Send for them.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

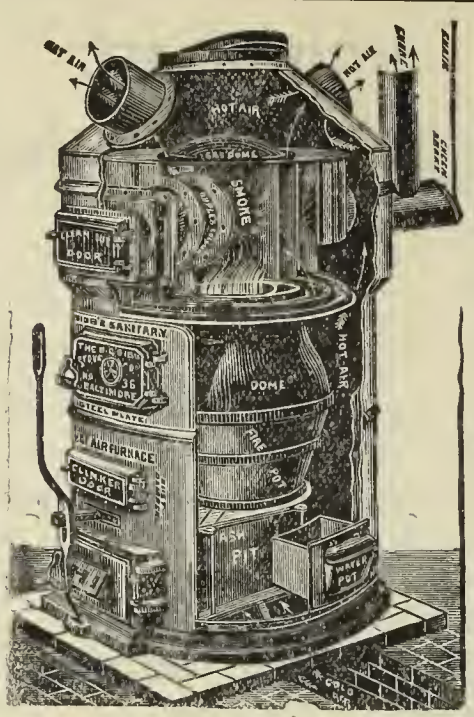
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

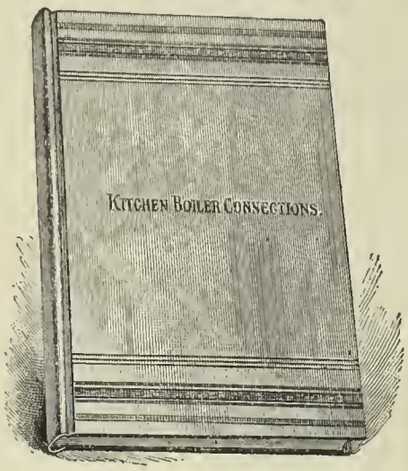
— BUSINESS.—"No," said Mr. Haicede, "I ain't goin' to pay no $10 fer this suit. It's second hand."

"Vat," shouted Mr. Achheimer.



"I say it is second hand. Second hand clo'es is them that has been wore, ain't they? An' didn't I have to wear the suit when I tried it on?"

"Vat a pity," said Mr. Achheimer, in admiration, "vat a pity it vas dot you vas prought up to pe a farmer. You got a pizness head dot vas simbly owit of sight."—*Indianapolis Journal.*

— THE phonograph has been put to a novel use in London. An article is read in front of the receiving funnel and the waxen cylinder is sent to the printer, who sets it in a duplicate machine and puts the tubes in his ears. He then regulates the speed to suit himself, and sets by ear instead of by eye.—*The Press.*

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

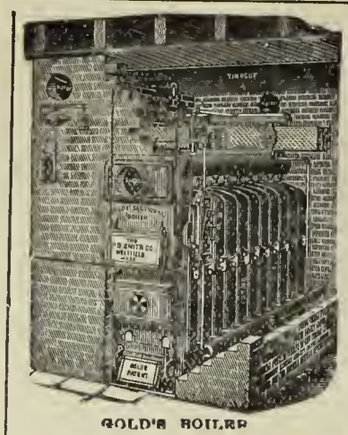
The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*



Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome —*Plumbers' Trade Journal.*

SECTIONAL VIEW, Hot Water.

Walking in the Rain.

"What am I going to do?" repeated the returned exile; "why I'm going to take a walk in the rain. It's a trick I learned in 'Hengland, dear boy,' and it's one of the most charming forms of exercise on top of this green earth. You see my costume; well, it's the dead copy of that in which a Cornish squire of my acquaintance used to walk in rainy weather over the downs that make up most of his estate. My laced shoes, you perceive, come well up the ankle, have heavy cork soles and have just been treated to a good rubbing-in of cold cream. I have stout woolen stockings and knickerbockers on, so as to avoid the flapping and contact of the wet trousers, and this cape mackintosh comes down pretty near to my heels. My underclothing is thick, but not heavy, and my clothes are of rough tweed that wouldn't be damaged if you'd let 'em lie in a stream for a week. Instead of a collar I wear a light silk scarf around my neck, over which I turn my coat collar and button it up so. This hat is a water proof fore and after. Umbrella? Why, of course not. That would destroy the very spirit, the very joy of your experience—which is to feel the rain beating in your face, the wet wind whistling about your ears, and the weather banging you about generally. You may not like it at first, but you soon will; and then you'll find there is a sort of wild joy about the thing that you can't resist. Catch cold? Why, of course not. In fact a course of walking in the rain is one of the best preventives against taking a cold. So long as you're moving briskly there's no danger of taking cold, no matter how wet it may be. It's the standing or sitting in wet things that's so dangerous, and so you must just walk from the time you leave the house until you get back; and then, when you do get back, strip off everything and give yourself a good rub. And if, as you put on your dry things, you do not feel like a new man with a new zest for the struggle of life, then I don't know a banana from an express wagon."—*Exchange.*

— When a man is through with his day's work and is sitting down resting in the home, he cannot read the advertisements on the fences, and the hand bills and circulars that were left on his door step during the day have been blown away or destroyed.—*Exchange.*

—"That was a very reasonable request the Rev. Mr. Whitetie made last Sunday."

"What was it?"

"He requested that no buttons be contributed for the heathen without garments attached to them."—*Herald.*

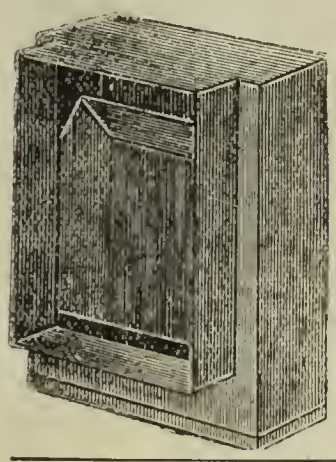
NO DULL SEASON WITH US.

We Did a Larger Business in 1894 Than Any Previous Year.

We know what the People want and make our goods to suit them. Our Gas Radiators are meeting with a great sale, and they are given the preference wherever they have been used.

WHY? Because they possess more real merit, give better satisfaction, are easier managed, handsomer in appearance, and burn less gas for the quantity of heat given than any in the world.

The WINTER IS NOT OVER YET. If you do not know all about them write at once, order samples, and be in the swim.



We also manufacture a full line of Gas Heating and Cooking appliances and Oil Heating Stoves.

Correspondence Solicited.

Board School Answers.

Pages might be filled with the answers given by the board school scholars. Here are a few specimens of the humor, conscious or otherwise, of these young folk:

"Faith is belief in what can't happen; Hope is belief in what won't happen; and Charity is belief in what does happen."

Does not this sound like an example of the new humor? It is in reality a genuine school board answer culled from an examiner's notebook.

"The act of uniformity," said a little girl, "was to make everybody go to bed at the same time."

"The kings of Israel," said a budding theologian to a reverend examiner, "must have been poor because it is stated that they slept with their fathers. If they had been rich they would have had beds of their own."

"Why is it wicked to cut off dogs' tails?" asked the teacher.

"Because what God hath joined let not man pull asunder," came the quick reply.

"Jerusalem was surrounded by walls to keep the milk and honey out."

"The cities of refuge were intended for those who had unintentionally committed suicide."

"Titus was an apostle who wrote epistles. He was the Emperor of Rome, and his surname was Oates."

"The hydra," said a little maid of five once, "was wedded to Henry VIII. When he cut off her head another one sprung up."

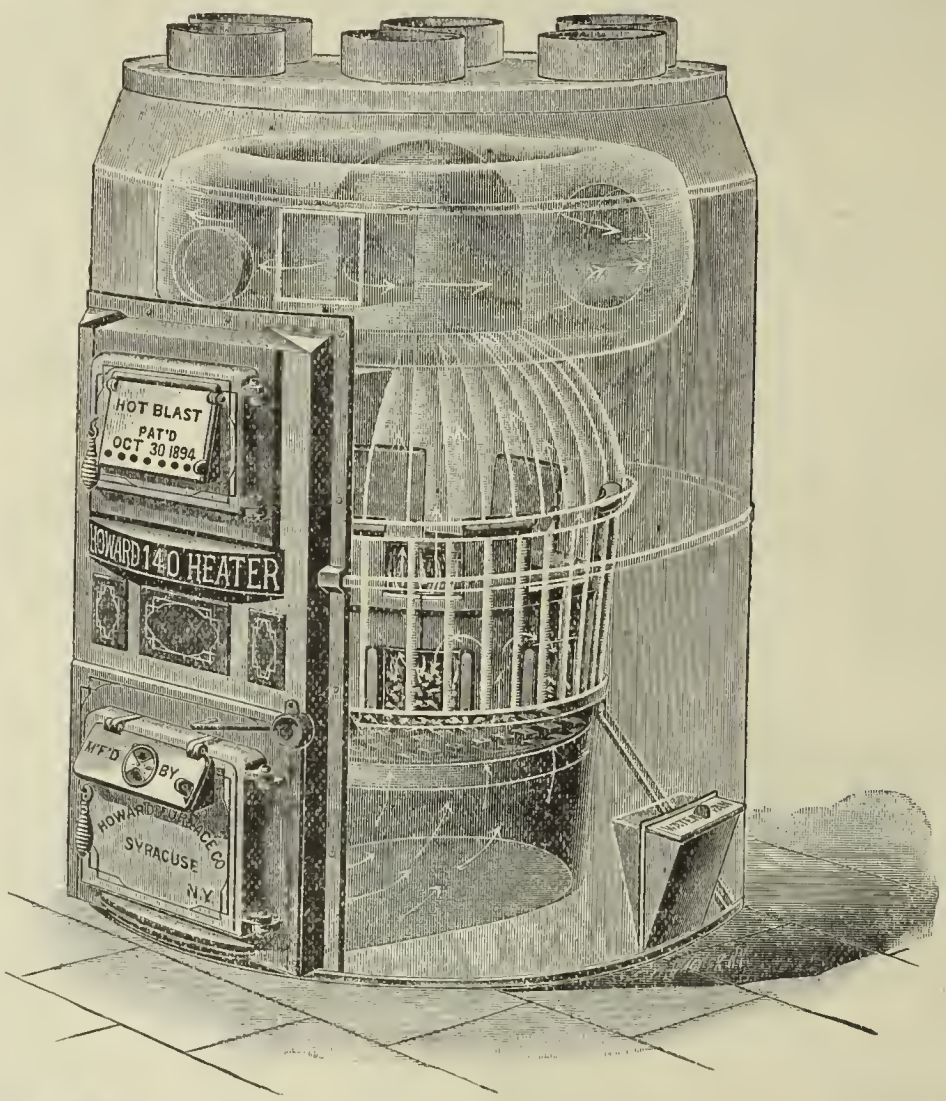
"The United States is governed by machinery" (who can deny it?).

"St. Peter was crucified head downward, because he mentions it."

"What were the Jewish feasts?"

"Beanfeasts," was the prompt reply.

"Mention an instance of charity in the Bible."



"They brought Him a penny, and He said, 'Whose subscription is this?'"—*Westminster Gazette.*

— "He lived retired, I know, but he surely left some friends behind him?"

"Not a friend; only a widow."

Retrospective.

The year 1894 has dropped into the past, and its departure is regarded with a feeling of relief by the many to whom it brought little else than disappointment and discouragement. It will long be remembered as the year of exceptional business depression and trade dullness. Following on a "panic year," its opening found the business interests of the country in a condition of extreme exhaustion, from which they have been for the past 12 months struggling to recover, through many and diverse hindrances. The close of the year offered, in many respects, a much more encouraging outlook than was presented at the end of 1893. The prospects were very gloomy at that time; but since then several causes of uncertainty have been removed and the country has overcome such obstacles as show its extraordinary power of recuperation in the face of difficulties and disasters and give hope and promise of better things in the new year. A casual glance at the happenings of the past year which bore more particularly on general business shows how eventful a year 1894 really was. The tariff and currency questions were those which exercised the most potent influence on the course of trade. The tariff was practically settled with the passage of the Wilson-Gorman bill, in the late summer, after a protracted and exasperating discussion in the Senate, during the course of which trade was almost paralyzed. It passed too late to favorably affect the fall trade to any great extent, and dullness and depression marked the remainder of the year.

Finance and Other Matters.

The currency question is still pending, but largely robbed of its terrors. The attempt to coin the seigniorage was frustrated by the President's veto, thereby removing one cause of possible trouble. The large shipments of gold abroad and the depletion of the Treasury reserve have been matters of constant anxiety during the whole year. The shrinkage in the Government holdings of the metal has been met by two bond issues of $50,000,000 each, and a third issue of a like amount is now talked of. Railway earnings have shown a terrible falling off, but this has been largely met by reductions in the operating expenses of the roads. Money has been a drug on the market, and speculation in stocks and bonds has reached only about one-half its normal volume in this market, notwithstanding the unprecedentedly low interest rates of money. Wheat, cotton, iron and other staples have sunk in price down to a level never hitherto dreamt of, diminishing the purchasing power of the producers and so affecting all trade in manufactured products. Added to these influences of depression were the great labor strikes of the summer in the coke and coal mining and railroad industries. At one time the transportation facilities of a great part of the country were held entirely in check, and the troubles reached such a serious pitch as to threaten a veritable revolution, requiring the aid of the Federal troops for its suppression. On the top of these troubles came the failure of the corn crop, and consequent losses to the farmers and the railroad companies which handle that crop. Besides these losses there were vast forest and prairie fires, floods and other disasters in various parts of the country, which wiped out an immense amount of property and caused distress and pecuniary ruin to a multitude of people. Truly this heavy catalogue of troubles was enough for one year, and we have reason for supreme thankfulness that the country has emerged into the new year in such good shape. May 1895 bring compensation to the disappointed in the shape of stimulated trade and commerce and renewed industrial activity.

Our American Tin Plate Lists.

In this issue is printed our third quarterly list of American tin plate works, together with an alphabetically arranged list of the domestic brands of tin and terne plates now on the market. The information therein given is compiled from reports kindly furnished by the manufacturing firms to *The Metal Worker* within the last ten days. They are therefore as accurate and comprehensive as possible. These lists have been found very useful by our readers, and we have endeavored to make them as complete as possible. The present exhibit contains the names of a number of new works now in course of erection, and fairly shows the condition of the tin plate manufacturing industry in general at the close of the year 1894.

Business Mortality in 1894.

The record of the business failures during the year 1894 of course shows a striking contrast with the stupendous aggregate of the panic year 1893. The number of mercantile failures in 1894 was still large, being 12,721, against 15,560 in 1893, but they were far smaller. The figures compiled by *Bradstreet's*, which refer only to those concerns whose actual assets were smaller than their liabilities, show that the assets declined from $262,415,851 in 1893 to $79,755,067 in 1894, and the liabilities from $402,427,818 in 1893 to $149,595,434 in 1894. The percentage of assets to liabilities has declined from 65 per cent. in 1893 to 53 per cent. in 1894, which is chiefly due to the fact that during the panic year business houses which would be solvent under ordinary circumstances were forced to succumb.

Bradstreet's groups the number of failures as follows:

Number of Failures.

States.	1894.	1893.
Eastern	1,784	2,139
Middle	3,018	3,415
Western	2,885	4,371
Northwestern	1,247	1,630
Southern	2,202	2,419
Pacific	1,182	1,202
Territories	403	384
Totals	12,721	15,560

The assets in the different groups stood as follows:

Assets of Failed Business Houses.

	1894.	1893.
Eastern	$7,826,381	$23,867,874
Middle	26,421,055	74,119,915
Western	18,132,474	81,003,224
Northwestern	8,824,874	42,626,570
Southern	11,623,102	24,780,822
Pacific	5,719,936	13,505,493
Territories	1,207,245	2,511,953
Totals	$79,755,067	$262,415,851

The liabilities grouped in the same manner show the following totals:

Liabilities of Failed Business Houses.

	1894.	1893.
Eastern	$18,790,018	$45,465,110
Middle	51,493,787	124,381,173
Western	30,138,654	109,485,547
Northwestern	15,201,215	62,375,448
Southern	21,285,698	38,478,231
Pacific	10,608,257	18,268,459
Territories	2,077,805	3,973,850
Totals	$149,595,431	$402,427,818

A curious fact is brought out by the returns, and that is, that the number of concerns in business declined during 1894. It passed one million in 1891, being 1,010,000, rose to 1,035,000 in 1892, increased to 1,050,000 in 1893 and then dropped to 1,047,000 in 1894.

An interesting comparison is also made concerning the bank suspensions during the two years under review. Within two years 174 national banks closed their doors, temporarily or otherwise, owing $73,718,000 and having $89,184,000 to pay it with, a large proportion of them resuming business. In the same two years 219 State banks shut down, permanently or otherwise, owing $40,887,000 and having $45,409,000 assets. Private banks present a total of 220 closed within two years, with liabilities of $28,935,000 and assets of $27,828,000. The 56 savings banks reported embarrassed by the panic year 1893 and during 1894 show total debts of $18,846,000 and assets of $19,307,000. Loan and trust company embarrassments within two years number, as reported, 17, with $23,400,000 liabilities and $14,867,000 assets.

THE LETTER BOX.

Galvanizing Iron Castings.

From A. & S., *Penn Yan, N. Y.*—We would like to be informed through the columns of *The Metal Worker* of a good formula for galvanizing small iron castings, just as they come from the rattler.

Answer.—The process of galvanizing, though an easy one in theory, requires considerable practical knowledge and experience to produce satisfactory results. The pot for holding the melted zinc is usually made of wrought iron and should be very heavy to be of sufficient strength to hold the contained zinc. The pot, as a rule, is set in brick, supplied with a coke fire about the bottom and sides, and should contain a sufficient amount of zinc so that the temperature will not be rapidly reduced as the articles are immersed. The surface of the zinc is covered with powdered sal-ammoniac to protect it from the action of the atmosphere, and also to act as a flux. An addition of about 3 per cent. of tin to the zinc improves the appearance of the work. The molten zinc gradually takes up iron from the pot and from the articles galvanized. This formation being heavier than zinc, sinks to the bottom of the kettle while in a melted state and at rest. The action of dipping mixes the alloy with the zinc and gives a rough appearance to the work. As a remedy, the melted zinc should be allowed to stand until the alloy has settled to the bottom of the kettle, when it can be removed by means of a perforated iron skimmer. As the sal ammoniac and atmospheric oxygen act to a certain extent on the molten zinc, a scum is formed which must be removed from time to time. The sal-ammoniac covering the zinc is also vaporized during the process of galvanizing, and additions are to be made as required. The first step to be taken with the castings is to remove the outer scale or oxide, and much of this can be done with the rattler. If the castings are sufficiently clean for galvanizing, well and good; if not, they can be scoured with sand or coke. As much of the success of the operation depends on a clean surface, it may be neccssary to place the castings in a bath of sulphuric acid and water. If desired, the articles can be kept for some time after cleaning by being covered with pure water. They can then be dipped in muriatic acid, dried in a reverberatory furnace, or on a sheet of iron placed over a fire. While hot the castings are taken and placed in the melted zinc, and allowed to remain for a short time, when they are taken out, the superfluous zinc being allowed to drain off, or removed by brushing. Small castings can be taken out of the zinc by means of an iron skimmer. They must be separated before cooling so they will not stick together.

Pipe for Heating Water.

From S. B. C., *New Orleans, La.*—The tank is to be constructed of a capacity to admit of 40,000 pounds of water per hour passing through it. The water system is to contain 10,000 pounds, and to pass through the tank four times an hour. The water is supposed to be heated to 160° at its entrance to the tank, and is to leave the tank heated to 210°; in other words, to be increased 50° in temperature. The question is, how many feet of 1-inch pipe will be required to give the requisite heating capacity from steam? The size of the boiler is supposed, of course, to be sufficient to supply the necessary amount of steam. The tank can be made in any way that suits the engineer's fancy. The one thing desired is to heat the water under the conditions above given.

Answer.—With steam at any pressure per square inch, vertical inch pipe heating surface will transmit 76 heat units per hour for each Fahrenheit degree of difference between the interior steam and the exterior liquid, and horizontal each pipe will transmit 110 heat units. The total number of heat units to be transmitted is practically found by multiplying the weight of water—in the present case 40,000 pounds—by the number of degrees its temperature is to be raised, in the present case 50° F.

$$40{,}000 \times 50 = 2{,}000{,}000,$$

which is the number of heat units the pipe will have to transmit.

The total difference of temperature with steam at 212° (assumed to be the temperature at which steam passes through the pipes) is 212° − 160° = 52° F. But assuming that the water is run into the tank in a body at 160° F. and raised to 210° by the steam pipes, the temperature within the pipes will remain constant while the temperature of the water will be gradually raised. The average temperature of the liquid will therefore be 185°, and the average difference of temperature will be 212° − 185° = 27° F. As each foot length of vertical pipe will pass into the exterior liquid 76 heat units per hour for each degree of mean difference of temperature, $27 \times 76 = 2052$ heat units, and $\frac{2{,}000{,}000}{2052} = 975$ feet run if the pipes are arranged vertically. Similarly, $27 \times 110 = 2970$, the number of heat units each foot in length of horizontal pipe will pass into the liquid hourly, and $\frac{2{,}000{,}000}{2970} = 674$, the number of feet of horizontal inch pipe needed.

If live steam be used less pipe will be needed, depending upon the pressure carried. But exhaust steam will be available, and is generally used for heating liquids when it can be so used, and it is economical practice to do this. The exhaust from a 70 horse power engine using 30 pounds of water per horse-power per hour would do this heating; and in general every pound of exhaust steam gives off 966 heat units in heating water; therefore $\frac{2{,}000{,}000}{966} =$ 2070, which is the number of pounds of exhaust steam required.

Evans Hot Air Furnace.

From B. C., *New York.*—Can any reader of *The Metal Worker* tell me where the Evans hot air furnace is manufactured, or whether it is at present on the market?

The new British torpedo boat destroyer "Ferret" is, says an English service journal, simply a box of machinery from end to end. Her length is slightly in excess of the old time line of battle ships, and her beam is one-third less. Under forced draft she can be driven at a speed of about 27 knots per hour. Armed with two quick firing guns and four torpedo tubes, she can pursue and overtake the swiftest torpedo boat afloat, and with her more powerful gun fire, destroy her. Four funnels, four boilers, triple expansion engines, making at their highest speed some 400 revolutions per minute, steam steering apparatus, and machinery for working anchors and cables, all crowded into the narrowest limits, make up this result of modern mechanical engineering and shipbuilding skill.

A Jacksonville special asserts that the severe frost of last week will entail a loss of about $3,000,000 to the fruit growers of Florida.

A statement of the capital invested in and the value of the annual product of each manufacturing establishment at Muncie, Ind., compiled by a Cincinnati newspaper, places the aggregate capital at $4,402,000 and the annual product at $11,572,000.

It is stated that the railroad suspension bridge at Niagara Falls is to be superseded by an arched cantilever structure. It is also understood that the 1200-foot roadway suspension bridge near the falls will be replaced by an arch bridge.

ROOFING AND CORNICE.

The Roofing and Cornice Trade.

IN A ROUGH WAY it is true that the condition of any one of the larger industries of the country is a measure of the general prosperity. We seldom find in any business analysis that there is profitable activity in one line of trade while the reverse conditions exist in other lines. So, therefore, as might have been expected, the record for the roofing and cornice business is not a lively one, nor has the trade brought wealth to its members during the past 12 months.

Too Much Legislation.

The gist of the reports that we have received from all over the country is that profits have been small, if any, competition has been sharper and the volume of trade diminished. It is noteworthy that many correspondents have complained of the work of our national legislators. We do not refer merely to the tariff policy that is associated with one of the political parties, for in that matter the correspondents write one way or the other according as they happen to be Republicans or Democrats. But what is impressive is that so many of them, as is the case in every other line of trade likewise, complain of the uncertainty which overhangs all business so long as there is danger at any moment of tariff enactments changing the situation.

One correspondent living in the South writes: "The only thing that we need is about three years' freedom from sittings of Congress. If they will only leave the tariff and the finances alone we will come out ahead." Another correspondent in Chicago says: "If the Congress of the United States would make some settled agreement on the tariff business and let it remain for ten years, I believe the people, as a whole, would be much better off."

Machinery.

There is a marked tendency in all trades to subdivide labor and utilize machinery, and the building trades are no exception. This change is a subject of note in the roofing and cornice business, for, as one of our correspondents points out, "there is a growing tendency to buy everything in the shape of piping, gutters, repair tin and other goods ready for use instead of putting the material together." The number of concerns dealing in cornices and roof finishing materials, that is, finials, crestings and the like, is constantly increasing, and the country tinner is now in a position to buy ready made all the material necessary for a very handsome piece of work. The increasing interest that is being taken in sheet metal for interior finish is notable, the demand for ceiling and side wall plates having increased not a little.

Competition.

In looking over the communications that we have received from members of the trade, there is a startling unanimity in the answers that have been given to our questions concerning the competition and profits. Not a single correspondent has said that competition was less, and very few admit that it was not worse than last year, all the rest saying it has become keener. One correspondent expresses it "as meaner, fiercer and more reckless than ever before." A Minnesota correspondent complains that "a large number of men who formerly worked by the day, not being able to get work, have bid for contracts, basing their profits on a day's work for themselves and trusting to luck to get the materials, and paying for the materials and for their men's wages when they get the money. This is hard on those who have capital invested in a plant and is a source of a great deal of annoyance."

Another correspondent, writing from one of the Eastern States, alludes to the poor work that is resulting from such keen competition. He says: "The greatest trouble with our business in this city is the deplorable tendency to slight work, and the motto seems to be, anything is good enough so it will pass. Very few take any pride in doing good work, and the architects help this state of affairs along by accepting work that should never pass. The consequence is that they can afford to do it cheaper than others and get the most of the work. This is very discouraging to any one trying to do good work and trying to keep up a well earned reputation for good work."

Profits.

Profits have been almost invariably less. The figures given show a reduction from 10 to as high as 75 per cent., though, leaving out the extremes, a fair average of profits would be about 20 per cent less than last year. Eastern manufacturers are being pushed by Western concerns, one of the well-known firms in this part of the country saying that the Western competition reduced their sales 40 per cent. below what they were two years ago. Another conservative business house having to do with sheet metal machinery say that their gross profits, compared with previous years, have not been reduced, but that the expenses for selling have so increased, in consequence of keen competition, that the net profits are considerably smaller than they have been.

Volume of Trade.

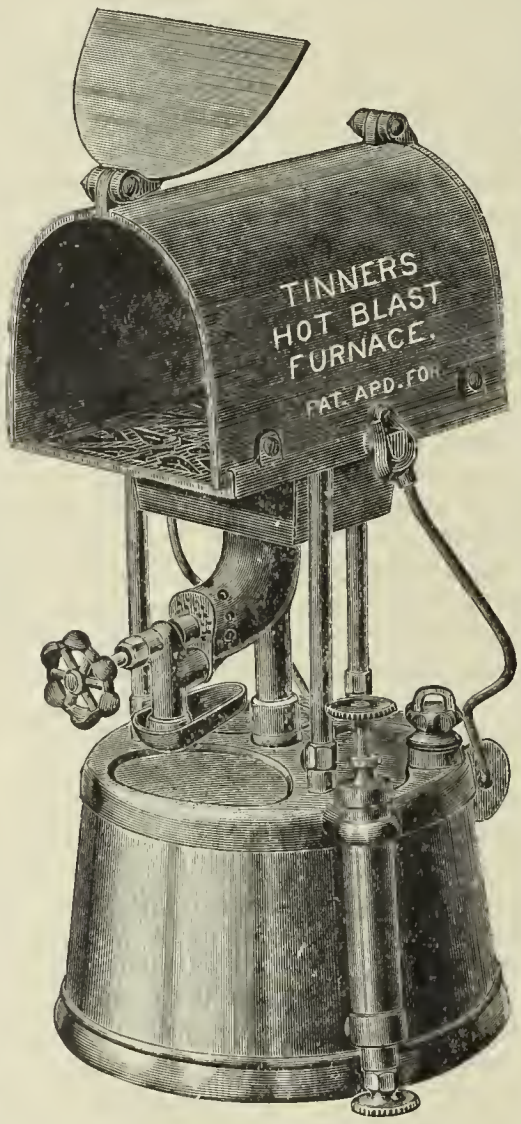
Respecting the volume of trade there is considerable diversity of report, though the general average shows a reduction compared with previous years. During the early part of 1894 the falling off was considerable, but later in the year business picked up, but not in all cases sufficiently to cover the reductions of the early part of the year. This point is dwelt upon by some of our correspondents, who draw a line around the first of July. In another case, the first eight months of the year are reported as bad. The reduction in volume from those who have furnished actual figures would average up in the neighborhood of 30 per cent. Local causes have affected the trade in some respects, as, for instance, one correspondent, who is adjacent to the cotton district, says that the large crop of that staple created a big demand for their sheet metal roofing and siding for erecting cotton warehouses and compressors.

Encouraging Features.

In spite of the unsatisfactory showing in the volume of business and the low profits there are encouraging features to note in the record of the year. The struggle has made all people conservative, and there is a general feeling that the condition of the purchasing classes is better than it had been. One would have thought, in view of the lessened business and unprofitable times, that the buying public would be less able to purchase and credits generally would have been unstable. The fact that this is not so, however, is particularly gratifying. Many report the situation in this respect unchanged, while a large number say it is improved. It must be borne in mind that, in part, this more satisfactory report is owing to the greater care that has been taken in extending credit. Accounts have been scrutinized in a way that they have never been before, and after the panic of 1893 the financial standing of customers has been looked into more narrowly. Another thing is that the buying classes have seen the necessity of economy, and are paying for neces-

saries instead of getting credit for luxuries. A correspondent in the East who does business all over the country gave as the record of his experience that a more increased strength was noted in the East and South than in the West, but this is hardly in agreement with reports we have received from the South itself, one prominent firm writing: "The low price of cotton has greatly weakened the finances of the dealers in the cotton belts; also sugar planters have suffered some." The same correspondent speaks of the congested state of the markets, and believes that relief can only come by increasing the demand either at home or abroad, or else making less goods and turning the flow of population from the cities to the agricultural sections.

A Pennsylvania firm, speaking of their sales, state that they have been smaller, but payments have been more prompt, the demand coming not so much from the large trade as from the smaller dealers. A correspondent in Houston, Texas, speaks of the competition that they are meeting from tin shops who, with neither character nor credit, are doing cornice work at prices that are absurdly low. Speaking of the general trade in Texas, they say it is in a little better condition than usual. "The whole community seems to have adopted a hand-to-mouth policy during the past year, and as a result the country merchant has not overloaded his store with goods nor his books with doubtful credits, and there is encouragement in the conservative policy that the people in general are pursuing. We feel that the foundation for a solid prosperity is being laid during these hard times in the lesson of economy and self reliance that the people are learning."



The Outlook.

So far as the past is concerned it is a matter of record and the business man knows from his books whether his trade has increased or decreased and at what profit it has been done. Dealing with the future, however, is quite different. The prophecies are largely a matter of temperament, or they are affected by the profits of the year that has passed. If things have gone well with a firm they are hopeful of the future, but it is hard to prophecy smooth things with a losing trade to look back upon. The roofing and cornice trade is, in a sense, a secondary industry, since it depends upon the building trade for its prosperity. There appears to be a good deal of talk about new buildings, but some of our correspondents complain that the contracts are not being let, so that there is no certainty that actual activity will result. One of the conservative Western houses, well known in the trade, say: "Our opinion is that there is no prospect of activity until the great questions which are being tossed about by our *intelligent* Congress are settled and they go home to their farms."

A Canadian correspondent refers to the way his business is being injured by the use of cedar shingles, and adds that the people generally prefer wood to metal for roofing "on account of its first cost being less, and also because their great-grandfathers used wood." The American manufacturers may congratulate themselves that, with all the obstacles in the way of their prosperity, they do not encounter a similar prejudice against new goods merely because of their novelty.

New Roofers' and Tinners' Furnace.

The White Mfg. Company, 40 and 42 State street, Chicago, have just brought out the new design of roofers' and tinners' furnace which is herewith

New Roofers' and Tinners' Furnace.

illustrated. It will be observed that the hood on this furnace is made of cast iron, with a swinging door at each end. These doors are hung at the top so that their own weight swings them shut, while the hinges have long arms to enable the doors to be opened back on the top of the hood when so desired. The hood is of large size to accommodate soldering irons of any description. It is claimed that by the construction employed every particle of heat is saved for the irons, none wasted. The utmost care has been taken to make this a perfect furnace, for use in the strongest wind. The burner has a generator of double strength, which, it is said, will not clog up. It will run for three hours without pumping and the heat can be regulated to any required degree. The burner has a patent renewable needle valve seat, which can be replaced at very slight cost when worn out. The reservoir is spun out of one piece of heavy sheet brass, covered with a cast top, constructed so as to neither sweat nor leak, tested to 50 pounds pressure, capacity for 1 gallon of gasoline and able to run the furnaces for 10 to 12 hours without refilling.

FLASHINGS.

J. J. Colvin, 159 La Salle street, Chicago, is to furnish the galvanized iron work for the residence of Joseph F. Ward, Evanston, Ill.; also the galvanized iron, tin and copper work for the residence of E T. Malone, Oak Park, Ill.

All the slate quarries in the Bangor (Pa) district shut down on January 1, owing to the cold weather. They will continue inactive until spring.

M. Cullen, Hartford, Conn., writes that he has been very busy during the last of the year with contracts for sheet metal work in cornices, skylights, inside metal work and some copper work.

John Seton, 78 and 80 Washington avenue, Brooklyn, N. Y., has installed in his shop a new press for cornice and skylight work, weighing 20,000 pounds, manufactured by Geo. A. Ohl & Co., Newark, N. J., which he refers to as the most perfect machine so far made for this line of work.

The Garry Iron & Steel Roofing Company, Cleveland, Ohio, in anticipation of a better business, are enlarging their works, and are going into the manufacture of iron trusses, &c., and a general line of architectural work in iron and steel. They also expect to push the cornice, eave trough and conductor trade more extensively the coming season. Their fire proof shutter has, we understand, been adopted by the Board of Underwriters and is meeting with a large demand.

Wagner Bros., 1350 Diversey street, Chicago, have finished a fine job of copper and galvaniz d iron work on the Masonic Temple, Ravenswood, Ill., including a large emblem in copper which ornaments the front of the building.

Sheet Metals.

Reports with which we have been favored from manufacturers of sheet metals operating in widely separated portions of the United States indicate that the year just closed was one of trial to those industries. This is especially true of the sheet iron trade. Partaking of the general depression which affected all trades to a greater or lesser extent, the sheet iron business, for the greater part of the year, suffered severely from the extreme dullness of the building and other trades, which constitute their principal clientage. Fierce competition for such orders as were available resulted in a shearing down of prices to an extent out of all proportion to the decline in raw materials. Many mills were forced to close down

and remained idle for the greater part of the year. Others were forced into the hands of receivers. Efforts were made from time to time to strengthen prices for black and galvanized sheets, but without avail, and the year closed with prices down to the lowest level known.

During the last quarter of the year, however, the demand for sheet iron showed a gratifying expansion. Stocks were reduced to a very narrow margin, owing to the large reduction in output, caused by the closing down of a majority of the mills. The reviving demand encouraged idle plants to resume operations, and in the last months of the year the trade experienced quite a little boom, so far as the volume of business went. Prices, nevertheless, continued weak and the margin of profits to the makers far from satisfactory.

The Eastern Manufacturers.

Eastern manufacturers of sheet iron place the shrinkage in volume of their business at from 25 to 50 per cent. Probably about 30 per cent. represents the average loss throughout the mills. Competition is generally referred to by them as being keener than ever, and the margin of profit much less than in previous years. As a rule, the manufacturers have found collections satisfactory, although some of their weaker customers have failed them.

A firm in the Schuylkill Valley of Pennsylvania, manufacturing sheet iron and steel, refer to this subject as follows:

"Those customers that have always been good are now better, there being a disposition with such houses to discount all bills. Those that have heretofore been doubtful or slow are slower than ever now. Failures, however, have been less frequent than in 1893, and smaller in amount. This is the only encouraging feature for the present year as compared with last."

This concern, unlike most, see no particular encouragement in the outlook for 1895, and regard the new tariff as extremely damaging to their business.

Another large Pennsylvania concern, who report a falling off in the volume of their business of 25 per cent., regard the outlook as fair for the early part of the year, to be followed by improvements both in demand and prices.

Yet another firm in the same State mention a loss of as much as 50 per cent. in the volume of business done, with shrinking profits. They do not look for much improvement this year. The general tendency of manufacturers in that section is, however, to the view that the business of 1895 will be fair in volume, but at very close margins.

The Middle States.

From a rolling mill in Ohio, producing black and galvanized sheet iron and steel, we get the following comparatively favorable report:

"Our tonnage will be 10 per cent. greater in 1894 than it was in 1893. Competition, however, especially during the last three months, was much stronger, and our margin of profit will be at least 25 per cent. less than in 1893. We cannot trace any bad effects to the actual Tariff bill itself, as it gives our branch of common sheets and galvanized iron ample protection. But we feel that we are sufferers, in common with every one, from its general bad effect on the community at large. We believe that we can see an improvement ahead for 1895, which, while it may not advance profits to any great extent, will at least start prices upward. Our losses this year will come entirely from the smaller trade. All of our large buyers during the entire year have almost invariably discounted their bills, a marked improvement in that regard over other years."

Another rolling mill firm, located in Ohio, state that their output of sheet iron was only about one-half that of a normal year and less than one-third in dollars and cents. They anticipate a gradual improvement, however, in the present year. They offer the following pithy remarks apropos of the keen competition in the sheet iron trade:

"Speaking for the iron business—what it needs most is for the mills to get closer to the consumer, doing away with the army of brokers—don't mean the legitimate dealer who buys and pays for material, but the irresponsible genius whose stock in trade consists of a pink-eared stenographer and a roll top desk who preys on consumer and manufacturer alike."

A third concern, located in Michigan, write as follows:

"The business done by us will be, on the whole, about as it was last year. The first six months was light, but the last six months, being better than the last six months of last year, made up to some extent for the small trade of January to July this year. We have made a greater amount of goods, but the price, being lower, has left the volume of business in dollars about the same."

Southern Mills.

The mills in the Southern States seem, on the whole, to have fared far better than their Eastern and Western competitors.

A sheet iron concern in Wheeling, W. Va., report the volume of their business as having been somewhat larger than that of 1893, but not so good as in some former years. They look for an extra good business this year, on the principle that after a depression comes a great revival, and they think the late depression will prove no exception to the rule.

From a second mill in the same district we are advised of a fair average business done in 1894, under very satisfactory conditions as regards payments, customers having generally taken advantage of the system of cash discounts.

A Southern concern, manufacturing sheet iron and steel from No. 28 to No. 18 gauge, speak of having done a larger business last year than in 1893, the increase amounting to above 20 per cent. They add, however, that the margin of profit was so close that only by running full, with closest economy, could they make any profit at all. Payments with them were better than heretofore, on account of the system of cash discounts.

The Chicago Sheet Iron Trade.

Chicago is a very large market for light sheets, both black and galvanized. Roofing and cornice makers are heavy consumers, trunk makers are by no means an insignificant factor, the stamping works are of large capacity, and miscellaneous manufacturers of small sheet wares are very numerous. The field has long been an inviting one for the manufacture of sheets, and in 1892 and 1893 two mills were built in the vicinity of the city, but for some reason they dropped out of the contest and neither of them turned a wheel in 1894, abandoning the trade to the mills in Indiana and further east. It was very certainly not a year for large profits in the manufacture of sheets. Prices fell over $8 per ton from January to April, although the January price was much below the average of the preceding 12 months. Contracts for No. 27 common iron sheets were placed about the 1st of April at 2.20 cents, Chicago, for large lots, to be shipped from mill, and rumors were current of even lower rates having been made. But from that time a marked recovery set in, and the demand was sufficiently large to keep the mills well employed until the close of the year. An increasing preference was manifested for steel sheets by consumers generally, while in the stove pipe trade smoothly finished iron was in greater favor, owing to its considerably lower cost as compared with past years. Galvanized sheets showed the effect of the increased capacity of old works and the entrance upon the field of new ones. Occasionally during the year an effort was made to strengthen prices, but for the most part competition for business was exceedingly keen and prices were weak. The adoption of a new list on galvanized sheets early in the year was of little avail in checking the slaughter of profits. The consumption was increased locally by the rescinding of a city ordinance forbidding the construction of metal covered wooden bay windows and light shafts, but the effect on the trade was not so great as it would have been in a year of great activity in building.

The Pacific Coast.

From California a manufacturer of steel and iron sheets writes that the competition with foreign plates, No. 18 gauge and thicker, is very keen in San Francisco. The new tariff, he believes, will injure his trade in the sizes thicker than No. 18; the gain in lower rates on wrought iron, scrap or steel billets does not help him any, as domestic steel billets and scrap are cheaper. He concludes, in regard to the outlook as follows:

"The outlook for the coming year is better than for the past year. The timely rains this fall which have been general on this Coast have stimulated the hopes of everybody. A great

many irrigating schemes are likely to be consumated and this requires a large amount of light plates, Nos. 10 to 16."

Sheet Brass and Copper.

Brass and copper rolling mills have done only a fair business. Competition is referred to as being quite as sharp as in the previous year, while profits have been about the same. Manufacturers in this branch of business have had the advantage over their sheet iron contemporaries of being able to keep their works running at a fair working profit, and in some instances at a slightly better profit than formerly. The dullness in building operations during the year caused a considerable restriction in the demand for cornice copper. Some of our correspondents place the falling off in sales in this department as high as 50 per cent.

A brass rolling mill proprietor in Illinois writes that his business for the first six months of the year was much below 1893, but the latter six months brought a considerable improvement. He looks for an increase in the volume of business this year, and refers to collections as having been very satisfactory; money, he remarks, seems freer and payments come in with less urging. A similar condition is reported from New England. A correspondent in this industry, located in San Francisco, speaks of the year's trade in the Pacific Coast as having been very poor in the earlier portion, but better in the fall and since. Profits, he thinks, were slightly better, and he regards the outlook as promising a better business in that section.

Miscellaneous.

A great many trades with which the readers of *The Metal Worker* are more or less directly concerned have furnished us items that will be of assistance in summarizing the general industrial situation. From these advices we make some selections:

Hardware.

The reports from our correspondents in the hardware business are not uniform respecting the comparison of trade this year with a year ago. The majority, however, refer to a falling off in amount, the figures giving the average of about 10 per cent. Some few others have held trade even, while a lesser number report an increase. The latter, however, account for it in several cases by additional lines added to their business and by the fact that they deal in specialties which are not so much affected by hard times. The prospects for the coming year are not altogether unpropitious, according to the best opinions of our correspondents. There are, to be sure, reports prophesying evil things, but, taken as a whole, the tendency shows a belief in a brighter year. One Western firm say: "Altogether we believe that the entire country is in better shape than for two years past." Another writes in this conservative way: "We see no prospects of better results prior to July, 1895; at least values are still falling and the building trades are not looking up." This expresses the condition of things in one of the cities of Western New York. As an offset to this, however, we have the following report from another well known firm in one of the larger cities of that section:

"The prospects appear to be better; factories and shops in the city are more fully employed than was the case this time last year. There is considerable building in progress and more that is now certain to be commenced at an early date."

In Ohio the reports are generally favorable, one firm looking for a gradual improvement, beginning with the opening of spring trade, and another being of the opinion that they will do an average trade in 1895. One New York firm have a reason for not being over hopeful of the future, for they say that "the country at large cannot grow rich on 50-cent wheat and 5 cent cotton," and the same thing is alluded to in a report from a Texas dealer, who writes:

"The abundant cotton crop that has just been marketed here sold so much lower than usual that it seems to have taught the farmers a great lesson in economy, and they have in consequence taken more money home with them than usual."

The following opinion is from a manufacturer who comes in contact with the hardware and similar trades. He writes: "Our salesmen cover the greater part of the United States and they report that the outlook for the coming year is very favorable."

Refrigerators.

The reports that we have received from this important industry indicate that the volume of trade, as a rule, was less than during 1893, the reduction averaging some 25 per cent. One of the few concerns reporting an increase in business say that early orders were small, but having built freely they had the goods ready for prompt shipment, and as a result did a larger business than usual. They remark that the demand was principally for the medium and large sizes of refrigerators. The prospects for the coming year are considered brighter than they were 12 months ago. The Western manufacturers think it will be better throughout the East and West, but in the Northwest they are looking for no great amount of trade. In a general way they consider that the demand will be fair in quantity, but they are afraid that the competition will keep prices very near to the unprofitable point. The Eastern makers are anticipating better trade, and one manufacturer writes:

"Dealers are just as reluctant as at this time last year to place orders, and those that can be induced to do so make them small. A few have carried over stocks; but, inasmuch as they had bought sparingly, these stocks will soon be disposed of when trade opens and we believe orders will then be placed as freely as usual."

The same concern write favorably of the financial strength of the purchasing classes, saying that they have been able to make collections more promptly than usual. They add:

"If manufacturers and others insist on terms being more respected than in the past, it will tend to a more healthy state of affairs in this connection. The desirability of purchasers respecting terms, and manufacturers and jobbing houses insisting on their doing so, ought to be generally recognized."

One well known firm of manufacturers complain of the practice of dry goods and department stores handling refrigerators and selling them at little or no profit, using them as leaders and relying on their other sales for making money.

"Such stores," they write, "may be big institutions in their way, but they have more disastrous effects on trade generally and on the already insignificant wages of the American mechanic and laborer than any tariff that has yet been devised or tinkered with. We believe that any thoughtful man who spends his entire time in such a business as ours and visits the trade all over the country, as the writer does, will agree with him as to the injury that has been done to manufacturing industries and legitimate dealers by the class of stores referred to."

An important conference, called by the Welsh Tin Plate Workers' Union, was held at Cardiff on Saturday week to consider the situation in the tin plate trade. After long deliberation, the Executive Committee's report was approved, and submitted to the different branches for final decision. The report was as follows: "1. That the council should declare itself in favor of a uniform rate of wage. 2. That inasmuch as a reduction of wages of 10 per cent. below the standard of 1874 has been accepted, and is now in operation, and that further and heavier demands are made, the council, under present circumstances, strongly urge upon every body of tin platers, on no account to agree to a greater reduction than 10 per cent.; and further, to take care that no contract be agreed to extending further than the end of March, 1895. 3. That the seven districts be requested to elect one member each to act in conjunction with the 12 executive members, and that the tin plate masters be invited to appoint an equal number to form a board to deal with wages and other matters pertaining to the tin plate trade." Some of the tin plate workers in the Llanelly district have, however, expressed themselves in favor of a reduction of 15 per cent. They fear that unless the men compromise the matter and meet the manufacturers half way, most of the works will close indefinitely.

The familiar calendar of Bruce & Cook of Water street, New York, is the eighty-third annual announcement of that well known metal house. The calender is in the customary style of decoration, and consists of a large card with the months divided into small panels and arranged each side of a picture of the warehouse of the company. Of particular interest at a time when so much is being said of the weights of tin plates is the table printed on the back giving the weight per box of tin plates of all sizes and gauges.

PLUMBING and GAS FITTING.

Review of the Plumbing Trade.

THE CLOSING MONTHS of 1894 brought encouragement to all engaged in any branch of the plumbing trade. Our correspondents in every part of the country, however, seem to agree that the volume of business was less than in 1893, when what has been termed "the panic" began. The reduction in the total amount of business done is variously estimated in some cases at as much as 40 per cent., and a general average based on these reports might safely be said to be at least 10 per cent.

One writer says: "The beginning of the year was slow, the present is better and on the increase." Another says: "Our business was materially less than in 1893, though the latter half of the year will, perhaps, show a small gain over the same period of 1893." Still another writes: "Our business is as good as it ever has been, but in ordinary times it would have doubled up."

Competition.

All have felt a sharper competition, which is reported by some to be "simply slashing." One says: "Competition is worse than ever before known, and in some lines cost of goods does not seem to be considered in making sales;" while another writes: "Profits are sacrificed to keep up volume of business; prices are too low in all lines of manufactured articles." A plumber reports: "Competition is sharper than ever. Many journeymen, through lack of work, have been compelled to take contracts for buildings at prices very satisfactory to the owners, the owners becoming responsible for the materials. The result is that work has been done at a lower price than is possible if association wages are paid, and a small advance is charged on the materials for a profit." A Western plumber says: "Competition is even sharper than last year. The firm that gets no work except in general competition is short of a profit, if not worse." A few report a good business, but, unfortunately, they are in the minority.

The Profits.

As a natural result, in such a depression as has been experienced throughout the country, and with the competition of the character reported, very few show any increase in profits. The majority report a reduction to the extent that only through a much larger output and a saving in the cost of production are they able to make the year's profits foot up to the amount of former years. The reduction may be estimated, from our correspondents' statements, at as much as 10 per cent. Some say "profits are less, owing to the cutting of prices without regard to cost;" others say "less margin of profit, prices badly cut," while still others say that "while the cost of material is less, the price of goods has been reduced out of all proportion with it, so that the margin of profit is much less and in some cases gone entirely." "Profits," according to an Ohio manufacturer, "are much less than former years or last year, but he hopes to make it up by larger sales." Another manufacturer writes: "Profits are better, due to smaller orders, and more of them;" while from another source we learn: "Prices are as low as they can go, and any change must be for the better and more profit."

The New Year's Prospects.

There is a disposition on the part of many who have money that is not earning much interest to go into real estate. This is marked by the busy condition of architects' offices and of the inquiries about land and material by contractors. The benefit to be derived from this movement will come first to the plumber and then to the manufacturer of plumbing goods. That better things are expected is shown by the opinions expressed. One writer says: "For the coming year prospects seem to be brighter;" another: "Prospects are very fair, and already we feel a little improvement in business." A plumber writes: "Things look brighter;" another says: "The prospects for the coming year are good and we are very hopeful. We do not like to say too much about it, but will be disappointed if we do not increase our present footings one-half." One manufacturer says: "From our inquiries we are preparing for a big year at good prices." Another says: "Things look better, money is being taken from stocks and speculation and put into real estate." Another writes: "With us prospects are A 1," and another: "A gradual improvement is expected by us, but no business of any magnitude for at least eighteen months." The prevailing impression of the situation is that the prospects are good unless some financial legislation checks the restoration of confidence that is now gaining ground.

Hard Times.

Having reached the bottom, as many of our correspondents put it, there is no reason why "better times" should not be talked to help things along. Several have asserted that many have used the "hard times and tight money" cry who were in no way affected by them, and thus made the times harder and collections more difficult. Some houses state that the conditions for trade are better, as there has been a weeding out of men who were incompetent to manage their business in a systematic way. A general impression exists that those who are likely to buy are able to pay. There is not so much trouble reported in making collections as might be supposed. Some state that their collections have been good and that there is an increase in hand to mouth buying, with a strong effort being made to secure the benefit of cash discounts.

The Use of Better Goods.

Never before could so much be secured for the money, which has materially aided in the introduction of strictly first-class goods, where formerly buyers could not be induced to consider them on account of cost. This has also brought domestic sanitary work into a prominence that has been alike advantageous to the owner and to the tradesman. With the increased use of exposed fixtures for all purposes there has been a decrease in the use of lead and solder work. This is a source of lamentation to some of the old-school plumbers, who, though they take pride, do not find consolation in the fact that their sanitary knowledge is still looked upon as invaluable in the construction of a system of modern plumbing.

New Articles and Methods.

The year has seen the introduction of many new goods in the various branches of the trade, and improvement has made some of the standard goods of the past seem very crude in comparison with those that have taken their place. New processes and methods of manufacturing for the reduction of cost have been general. One house says: "We have made no improvements of magnitude, but have many new devices and improved designs of standard goods." Another reports: "We have made changes in our goods by cutting off needless expense in cost in material and methods of doing the work." From another: "We have made a number of improvements in our tools, so that our output of goods is increased with no more labor than formerly." Some report new things that are being held back until the market is in a better condition for buying.

Associations of Master Plumbers.

The National Association of Master Plumbers has added to its membership and accomplished some things this year for which it has persistently labored in the past. Other matters are before its Executive Committee which will be treated in a businesslike manner for the good of all who come in contact with the association. Through the intimate acquaintance of its members, effected by their national and local meetings, the trade have less trouble from cutthroat competition and have raised plumbing, as a business and a science, to the high plane to which it belongs from the important influence it has on the public health. The association has much work before it to reach the mark set by some of its members, as is shown by the following: "I would like to see a National Board established to thoroughly investigate all systems of plumbing, with a view to establishing a standard that all plumbers could follow and feel that they were safe. This would avoid the competition with the 'go as you please' systems, each one the best in the mind of the originator. I would advocate a system of inspection that would give the property owner a correct idea of the condition of the plumbing in his premises, so that existing evils could be corrected. The next move would be to have examiners to pass on the qualifications of plumbers, and determine as to their competency to practice the trade. Then, by careful inspection, the incompetent or dishonest would be kept where they should be."

Learning the Trade.

The value of the trade school is being more widely recognized, and in several cities the master plumbers' associations shorten the term of apprenticeship one year to those who possess a trade school certificate. As the result of the benefits following a course in plumbing at the New York Trade School, plumbing classes have been formed in a number of cities of smaller magnitude. There are now several such classes in connection with other educational institutions in New York City, besides those in Philadelphia and Brooklyn.

Manufacturers' Associations.

During the latter part of the year the manufacturers of plumbers' supplies in different sections of the country have formed associations which is a new subject for consideration. These different associations work in harmony with each other and meet more frequently than would be possible with one national association, yet having all the advantages of a national body. There is said to be nothing in the course of action proposed that will be antagonistic to the interests of their customers, the plumbers.

Sanitary Earthen Ware.

The increased use of sanitary earthen ware is generally noticeable, and one correspondent says: "Where there was but 10 sanitary potteries in 1890, there are now 18 fully equipped, which has caused the selling price to come down with a jump that has affected the workmen. There is, however, no difficulty in procuring a full complement of hands to operate all of the potteries, but the demand is not for more than half of what can be produced." Vitreous earthenware is the latest pottery production to attract special attention. It is said to be perfectly non-absorbent and unaffected by changes of temperature. It is a general impression that the siphon closet is fast becoming the closet of the day for first-class work, as a better scouring and a deeper seal are secured.

Canadian Trade.

One correspondent from Canada says: "Prospects are very bright for next year and we are preparing for a larger volume of trade. The building trade expect to be busy and many large buildings are well under way." Another writer says: "As far as we can see we think we shall have a good season's trade." In commenting on the financial condition of trade the following remarks are made: "Although the complaint is general that collections are slow, we are able to collect pretty promptly in the majority of cases. There is a 'weeding out' process going on which will certainly force numbers 'to the wall,' but those left will be on a surer footing and will give a better basis to business than it has had for some time past."

The Chicago Master Plumbers.

The Chicago Master Plumbers held a meeting at their rooms, 107 Madison street, Thursday afternoon, December 27, at which there was a full attendance. The president and several committees made their reports, which were well received by those present. The election of officers for the ensuing year was the next in order, with the following result:

President, P. M. Murphy.
Vice-president, M. L Mandable.
Secretary, J. B. Breen.
Treasurer, P. Sanders.
Sergeant-at-arms, L. A. Larson.
Executive Committee: Paul Redieske, C. J. Herbert, M. J. Corboy, J. S. Webber.

The annual reception and ball will be held at the Auditorium Banquet Hall, Wednesday evening, January 30, 1895.

BROWN & WALES, Boston, Mass., advise us that they have made arrangements with Randolph & Clowes, Waterbury, Conn., manufacturers of the Brown & Bros. Copper House Boilers, by which they are enabled to carry a stock of these well-known goods, so that all orders can be filled promptly from their Boston store. They feel confident that this will be a great convenience to dealers in plumbers' supplies as well as plumbers themselves. They state that a difficulty has been that although these Boilers were frequently specified in contracts the plumbers were apt to provide some other make, owing to the fact that the Boilers could not be delivered as promptly as desired.

President Redieske's Address.

We print below the report of President Paul Redieske, of the Chicago Master Plumbers' Association, presented at the annual meeting of the association held December 27:

In presenting my annual report for the past year I will try in a brief manner to review the work of the past administration. When your officers assumed control of the affairs of the association for the year 1894, the plumbing trade of Chicago had just passed through a prosperous period. The great World's Columbian Exposition with its many magnificent productions had come to a close, but the dark cloud of distress (foreshadowed in our worthy ex-president, T. P. Culloton's, report of last year) which followed in its wake, has hung over this our great city for the past year, causing great destitution and financial loss, which a great many of our craftsmen and members were not fortuate enough to escape, but I think that I can safely say that the outlook for the future is again brighening, confidence seems to be gradually returning in all branches of business, and we may safely hope for a very prosperous spring.

After the election and at the first meeting of your Executive Committee of the past year, the first thing that was uppermost in the minds of the members of that committee was how to bring about a more hearty spirit of sociability and good fellowship among the members, and with that end in view the committee started to arrange an entertainment and ball, the success and pleasure of which no doubt are still fresh in your minds; and by your instructions to the committee a few meetings past to arrange for another you seem to be longing for a repetition of the same.

The next question for the consideration of the Executive Committee was the arrangement of a new agreement with the journeymen, and great credit is due to the Arbitration Committee who had the question in charge, for I do not think that there ever was a committee appointed by the association since its foundation that have worked harder and more faithfully for the interests of the association than they did. For three long weeks they sat from early morning until late at night to try and come to some settlement, and, in my mind, they arrived at the best settlement under the conditions then existing.

Next came the convention, and no doubt you have all read the report and noticed thereby that the delegates that you sent to Detroit represented this association in a creditable manner. Through the hard work of the National State Vice-President, Wm. Geary, with the assistance of your last Executive Committee, the Illinois Master Plumbers' Association is now an established fact and in a very flourishing condition, the first convention being held in Peoria last June.

One of the great things which this association is trying to accomplish is the passage of a bill governing the licensing of plumbers in this State, by the incoming Legislature, and every member of this, our local association, ought to see to it that the members of the lower house, as well as the State Senators of his district, will vote for the passage of this bill.

The next question that came up was the question that has been before the association since its foundation—namely, the apprenticeship question, and great credit is due the committee that have worked so faithfully for the past three months for a final settlement of this great question, and I hope that if it is not already settled by this meeting that a final settlement will be arrived at in the near future.

Our relations with the manufacturers and dealers in the past year have been of a very harmonious nature, with the exception of one, who is now out of the good graces of the association. All differences that have been referred to the Executive Committee have received prompt attention and a speedy settlement arrived at. The question of sub contracting is now receiving attention and has been placed in the hands of an able committee, whose report you will have heard to-day.

There is another very important matter to which I wish to call the attention of this association. You have no doubt all read the interpretation of the Baltimore Resolutions by the National Executive Committee. This, no doubt, will be the leading question at the next National Convention, and upon the right disposition of the same no doubt depends the future welfare of the

national as well as all local associations of master plumbers all over these United States. Yes, I do not think that it is assuming too much when I say that the very life of the national and the local associations, as well as every master plumber's individual business all over the United States, depends upon the right disposition of these questions of trade protection.

There are a great many other questions that I might enter into, which would prolong my report and make it cumbersome, but I think it is the duty of every member of the association to be present at all the meetings, so as to know as well as the officers of the association what is going on, and to watch over the interests of the association.

In conclusion, I wish to thank all the members of this association for all the kindness and forbearance shown me during the past year. Especially do I wish to thank the members of the Executive, Arbitration and Apprenticeship committees, as well as all other committees, for their promptness in attending the many meetings during the year, and for the assistance they have rendered me during the year.

TRAPS AND VENTS.

THE DIFFERENT master plumbers' associations throughout the country will soon be electing their officers for 1895. *The Metal Worker* will be glad to receive from the secretaries a list of the new officers for publication, as it is of interest for the plumbers of one city or State to know the officers of the associations away from home.

AT A MEETING of the Master Plumbers' Association of Cincinnati, Ohio, last week, the following ticket was placed in nomination: President, C. J. Nolan, J. J. Dowd, Richard Murphy, William Allison; vice-president, J. R. Gibson, Charles Atkinson; secretary, George Mellor, Jr., Frank Hopper; treasurer, J. D. Sullivan; sergeant-at-arms, T. D. Lynn.

AT A MEETING of the Plumbers' Supply Association of New England in Boston, December 21, the following were elected officers for the ensuing year: F. J. Knox of Hartford, president; Emory F. Souther, president of the Dalton & Ingersoll Company, Boston, vice-president; W. N. Goddard of King & Goddard, Boston, treasurer, and John B. Dupee, Boston, secretary.

THE ST. JOSEPH PUMP COMPANY, St. Joseph, Mo., report that during the year they have added a two-story 30x90 foot building to their plant and have put in two boilers and a 175 horsepower engine. They have also made some substantial improvements in their line of pumps.

THE AHRENS & OTT MFG. COMPANY, Louisville, Ky., will erect a new building, 180 x 60 feet, for enameling iron bathtubs.

THE ALBERENE STONE COMPANY, 217 Lake street, Chicago, are to supply ten combination laundry tubs and sinks for the building at 416–418 West Madison street.

"OLD PEPPER" CUSHING of the Knights of Tabasco has answered the letter which appeared in the trade press from the Executive Committee of the National Association of Master Plumbers, bearing the signature of President Mitchell. "Old Pepper" takes a dignified stand in his reply, and is positive in the statement that the "Knights" are a representative body of men and above the reflection which has been made upon them.

A CHARTER was issued November 14 to the American Porcelain Company, New Brighton, Pa., for the manufacture of earthenware sinks, wash trays, &c. The capital is $50,000, and the directors of the company are T. E. Marshall, Frank S. Reader, J. S. Boyd and Thomas Craven of New Brighton, and S. L. Marshall of Pittsburgh. The ware is of a light brown colored body, enameled with a heavy coat of perfectly white china, giving the same effect as white clay, with the advantage, it is claimed, of being harder burned and more lustrous. We understand that this ware has been subjected to many tests with excellent results. It has been proved to be proof against crazing, and the enamel cannot be separated from the body. The company have purchased the Scott Tile Company's works in New Brighton, which they have put in complete order and equipped with new machinery. The main building is 100 feet square, two stories high, with two large kiln houses, one 45 x 85 feet, and the other 40 x 60 feet. A large warehouse and office adjoin the railroad siding, giving excellent shipping facilities.

OWEN & SALTER, manufacturers of plumbers' supplies, Buttonwood and Twelfth streets, Philadelphia, are distributing a neat little vest pocket renewable memorandum book in fancy leather covers. The inside cover pages are utilized for describing their Maelstrom closet and Faultless basin waste.

THE PLUMBING SHOP of Walter Hager, Johnstown, Pa., was destroyed by fire on December 31.

THE BURGESS SOLDERING FURNACE COMPANY of Columbus, Ohio, inaugurated on the first of the year a new feature in the sale of their soldering furnaces. It is that all cylindrical cast iron burners of their Gem furnaces are guaranteed for one year against burning out, and during the period named the company will furnish one free of charge.

THE WADSWORTH PLUMBING COMPANY have been incorporated at Cleveland, Ohio, by Frank A. Wadsworth, W. A. Wadsworth, J. B. Wadsworth, G. H. Wadsworth and H. J. Link, for the purpose of doing a general plumbing, gas fitting, steam and hot water heating and sewer building business in Cleveland.

A PETITION has been sent to the City Council of Minneapolis, Minn., for the appointment of experienced plumbers as inspectors of plumbing.

COL. GEO. E. WARING, Newport, R.I., the well known sanitary engineer, has been appointed Street Cleaning Commissioner of New York City.

THE FLUSH TANK COMPANY, Richmond, Ind., are issuing a circular of their Siphon Eduction Closet Range for schools and public buildings. The circular gives a cut of the closet set up showing the flush tank, seats, the trap and drain pipe. By means of a siphon the range of closets are said to be effectually flushed periodically, after which there is 7 inches of clear water left as a separate seal under each seat. The closets are made in sections so that the number can be increased when desired. The company are also manufacturers of the Rhoades-Williams Automatic Siphon, the Field-Waring Automatic Siphons, and the Yeteve Raw Sewage Closet Systems.

THE ANNUAL ENTERTAINMENT AND RECEPTION of the Master Plumbers' Association of New York will be held in the Lexington Opera House, Fifty-eighth street and Third avenue, on February 12. The committee having charge of the affair and the tickets are John Yule, T. J. Tuomey, Charles Schloesser, T. J. Cummins and Milton Schnaier. Several specialists have been secured for the entertainment and the music will be furnished by a well-known orchestra.

SCRAP.

FORD & DONNELLY, Kokomo, Ind., are erecting a pickling machine of the Grey patent for the Atlanta Steel & Tin Plate Company, Atlanta, Ind., and also one of the same type for the Montpelier Tin Plate Company, Montpelier, Ind. These machines have a capacity of 45 tons per day.

ATLANTA STEEL & TIN PLATE COMPANY, Atlanta, Ind., expect to be rolling their own black plate by February 1 and not January 1, as stated last week.

A PRESS DISPATCH from McKeesport, Pa., states that the locked-out tin plate workers of the United States Iron and Tin Plate plant, at Demmler, Pa., have inaugurated a movement to erect a $40,000 tin plate plant. The McKeesport, Pa., Board of Trade has been invited to assist in securing a location for the plant. At a meeting of the Board of Trade a committee was selected to ascertain what inducements can be offered to the men to locate the works at McKeesport.

THE WORKMEN at the tin plate works of R. Thomas & Co., at Sydney, Gloucestershire, and Lydbrook, Herefordshire, England, have agreed to accept a reduction of 10 per cent. in their wages for three months. It is probable that the men at the Mellingriffith Works, near Cardiff, in which Messrs. Thomas are interested, will follow this example.

THE BALTIMORE IRON, STEEL & TIN PLATE COMPANY, Baltimore, Md., are reconstructing and enlarging their mill, at Locust Point, near that city.

GREAT WESTERN TIN PLATE COMPANY of Chicago will have their rolling mill and tin plate works at Joliet, Ill., in operation by January 21. The company will manufacture bright coke and terne plates, as well as black sheets.

THE ELWOOD TIN PLATE COMPANY of Elwood, Ind., have filed articles of incorporation with the Secretary of State of Indiana. Their capital stock is placed at $10,000, and the directors named are G. Samuel Allison, F. Marion Conner and Richard Howland, all of Richmond, Ind.

WE ARE ADVISED by a London cable dispatch of January 2 that a large meeting of tin plate workers was held at Llanelly last Saturday, at which it was decided to maintain the 36-box rule and refuse to accede to the proposed reduction of 10 per cent. in wages. Several Welsh tin plate works are reported as closing down indefinitely, including those of the Cynon Tin Plate Company at Aberdare, and the Upper Forest Works, at Morriston, South Wales.

PITTSBURGH TIN PLATE WORKS, New Kensington, Pa., are reported busy, having their full equipment of six tinning pots in operation. The concern are now rolling their own black plates. Their output consists of Kensington charcoal bright plates, Amber coke bright plates, and Kensington, Amber and Westmoreland ternes. The last named plate is controlled by Sidney Shepard & Co. of Buffalo and C. Sidney Shepard & Co. of Chicago.

STEAM AND HOT WATER.

Steam and Hot Water Heating Trade.

THE REVIEW of the trade which we present below was prepared for us by a prominent heating engineer, who has had every facility for studying the condition of business in this department.

General Review.

While many lines of business and manufacturing interests have suffered during the year 1894 through business depression, competition, and other causes, the heating of buildings—particularly private residences—by steam and hot water, or what has become known as the house heating industry, has advanced during the past year in appliances, methods of placing and amount of business done as compared with former years.

In addition to improvements in construction made in some of the older styles of heating boilers during the past year, a number of new constructions have been invented, patented and brought before the public, some by inventors and manufacturers who have already achieved fame and success in this line, and others by new aspirants in the field. Many of the newer constructions are but copies of older designs, from which some objectionable feature has been eliminated, or with some improvement added. In fact it would seem impossible in the present state of the art of boiler making in this country, with its hundreds of manufacturers making almost every conceivable shape and construction, to produce a house heating boiler that did not possess some of the features of the older constructions.

Types of Boilers.

Boilers are made of wrought iron, steel, cast iron, and a combination of wrought iron or steel and cast iron in one piece and in sectional form, portable and brick set, some with magazine feed and others surface burning, some with a direct draft only, others with a return flue only, and still others with both a direct draft and a return flue, with the many different circulations of water and gases and the different arrangements of surface. Plain and extended flat, rounding and corrugated drop tube. Fire box and flue surface arranged in different proportions, and when in sectional form with both the washer and screw joint, with and without manifold or drums, and with fire boxes round, square, oblong and oval, some formed of brick and others water lined, with bases or ash pits of iron or brick and with water lined bases.

Line of Development.

The type of boiler which has possibly been more fully developed during the past year, and which is being constructed in slightly differing designs by a number of manufacturers, is the vertical sectional cast iron boiler with screwed joints, a vertical circulation of water, a horizontal fire travel, a direct draft and a return flue, each section having its own proportion of grate area, fire and flue surface, and being arranged as a surface burning boiler. Many manufacturers advocate the use of a non-conducting covering on their boilers, some furnishing it as a part of their construction. This particular design has been very largely used during the past year, many of the newer constructions being of that type. Boilers with a direct draft and horizontal water ways have not been as largely sold as in the past. The older manufacturers have enjoyed a slightly increased trade, while those that have come into the field later seem to have taken up the natural increase of about 20 per cent. Prices have been firm, the only reductions being due to the reduction in cost of the raw materials entering into their manufacture.

Radiators.

Radiators have been improved in design and finish, and some new styles have been brought out. The older companies have extended and increased their trade, while a number of new companies have come into the field. Prices have been somewhat reduced, and the tendency has been to use plain rather than extended surface for direct radiation. With the growth of the steam and hot water systems mechanics in all sections of the country have become more familiar with the best methods for placing the systems; manufacturers have become more familiar with the actual capacity of their goods, and as a result we hear of fewer failures or partial failures.

Pipe, fittings, valves and other goods entering into the construction of steam and water heating apparatus have been slightly reduced in cost, making the cost of the apparatus from 10 to 20 per cent. less than in former years and thus helping to popularize the systems.

Steam and Hot Water.

As near as can be ascertained by inquiry among boiler and radiator manufacturers the percentage of steam apparatus placed during the past year has been about 60 per cent., while hot water apparatus has been about 40 per cent. of the total production. The present indications are that 1895 will show a marked improvement and a still further increase in the number of steam and water heating apparatus placed and we are also promised some new designs of boilers.

Opinions of the Trade.

Following after the review of the steam and hot water heating trades, it will not be without interest to quote from some of the reports that we have received from representative houses in different parts of the United States. It is pleasurable to note that the general feeling is that the future will not be without comfort to those who long for better business. A prominent manufacturer writes that he thinks the prospects for the coming year are very favorable, and adds the encouraging statement that the financial strength of the purchasing classes was, in his opinion, a great deal better in 1894 than in previous years. Another large firm in the East write:

"We think the prospects for the coming year are more hopeful, since there is evidence of more building and general business, and there are preparations for doing something."

The same firm, when asked for their opinion of the effect of the new tariff on their business, replied, "D—— the tariff." This may not be the most elegant way of expressing one's sentiments, but we have no doubt that it reflects the opinion of very many people who are longing for the time when the agitation of this agitating subject shall have ended.

A prominent steam fitting concern of New York City believe the prospects are very fair as to the volume of business, but think the future holds out little hope of any improvement in profits. A radiator manufacturer writes:

"The steam fitters, so far as we have come in contact with them, expect a good trade in 1885, owing to more and larger building enterprises; hence we look also for increased trade next year."

A conservative firm, writing from Philadelphia, say:

"We think the prospect promises a light business for a few months of the coming year, but hope for an improvement before the end of next year."

A prominent heating engineer, who has been connected with the business for many years, writes us rom one of the large Ohio cities:

"The prospects for the coming year I consider favorable, but think that next year will witness a greater reduction in profits in all classes of work, and also a reduction in wages paid to labor."

A well-known firm of New York contractors expressed the following opinion:

"Unless business improves and better prices are obtained it is our opinion that it is only a question of time when many parties now in business will be obliged to discontinue. Only strong firms can stand a continued pressure like that of the past year."

As a closing quotation we print an opinion from the president of a well-known firm of steam engineers and contractors whose reputation has extended far beyond the New England States. Our correspondent writes:

"For the last six months we have seemed to be going through a long tunnel on a level grade. This tunnel apparently has a curve in it so we can't see through, and consequently we don't know whether we shall come out into daylight in three months or three years."

National Fitters' Association.

Increased activity has been shown by the National Association of Master Steam and Hot Water Fitters of the United States since the annual convention in New York last June. At the convention a number of interesting papers were read by its members, and an English engineer, David M. Nesbit, a guest of the association, also presented a paper. The Executive Committee have held regular meetings, an important one having been held on September 30, when what is known as the "Trade Resolutions" were passed. The deliberations of the Executive Committee have been issued to the members in the form of a bulletin that they may know just what is being done in their interests.

New Associations.

During the year two new associations have been formed that are of interest to the heating trade. One is the Association of Boiler Manufacturers formed in New York and which recently held a meeting in Detroit. This organization has considered its affairs of no public interest and its business has been transacted in private.

The American Society of Heating and Ventilating Engineers is a newly formed association that already includes many prominent members of the trade and gives promise of a successful career. A preliminary organizing meeting was held during the fall and officers were elected to serve until the first regular convention, which will take place in New York on January 22.

Another association, or rather set of sectional associations, has been formed by the manufacturers and jobbers of supplies which has excited some comment, though it is claimed that its objects do not conflict with the interests of the trade.

HEATING NOTES.

THE SOUTHERN HEATING COMPANY, Louisville, Ky., whose incorporation was noticed in *The Metal Worker* of December 15, are representing the following concerns: J. H. McLain Company, Canton, Ohio; Buffalo Forge Company, Buffalo, N. Y.; Powers Regulator Company, Chicago, Ill., and the Dean Steam Pump Company, Holyoke, Mass. The Southern Heating Company, we understand, are desirous of receiving catalogues, price-lists and discounts of all goods in their line.

THE THEO. JACOBS COMPANY, 72 and 74 Market street, Chicago, engineers and contractors for steam and hot water heating apparatus, have been succeeded by the Charles H. Simmons Company. Charles H. Simmons is president and treasurer, C. M. Simmons is secretary, and W. H. Finney is general manager. The management of the company thus remains unchanged, still being under the care and supervision of Charles H. Simmons, who has practically had charge and control from the time of the company's inception ten years since. The company assure their patrons that their facilities for doing business are to be better than ever, keeping up the reputation of the concern for progressiveness. It is their aim to make each job of heating better than any that preceded it. The company have just issued a very neat pamphlet giving a list of architects and owners for whom they have furnished their improved heating apparatus.

WRAY, WENTZEL & ROBINSON, Bellwood, Pa., who recently purchased the plant of the Robinson Company, are issuing a four page circular of the Popular hot water fire place, printed in red and blue ink on fine paper. The first page shows a general view of the fire place and the second page gives a horizontal section, showing the grate bars, the water section and the air spaces. The third page shows a vertical section of the fire place set, with outside air supply, two hot air registers, expansion pipe and flow and return pipe to two radiators. The fourth page illustrates a cottage and plans with the fire place arranged for heating four rooms. Between the illustrations the text describes the apparatus.

WE HAVE RECEIVED from the A. A. Griffing Iron Company, Jersey City, N. J, a bound copy of their "M" catalogue. The book contains several new features showing the Bundy Semi-Renaissance radiator, the Elite and Columbia radiators, with top box, base, corner and grouped in all hights. The Bundy Newport radiator, like the Climax, except that it has three barrels instead of two, is also illustrated. The new Bundy giant pipe hanger and the Bundy steam return and tank traps are shown, likewise the Power regulators and the Major elastic couplings, Bundy comfort foot rests and other specialties. The catalogue is of convenient shape and well printed.

THE EXECUTIVE COMMITTEE of the National Association of Master Steam and Hot Water Fitters of the United States are sending from the headquarters in the Cable Building, New York, Official Bulletin No. 5. The feature of this bulletin is the comments on the action of the recently organized supply associations, which action is construed to be opposed to the Trade Resolutions passed on September 20. The bulletin contains a resolution passed by the Eastern Supply Association, a letter in reference to it by John Mitchell, president of the National Association of Master Plumbers, and a letter from the Henry McShane Mfg. Company. The bulletin announces that there are 450 houses manufacturing goods used by its members, of which 126 have expressed themselves in accord with the Trade Resolutions. A full list will be printed and sent to the members in a later bulletin.

THE SCHEDULES in the assignment of Richard M. Johnson and George G. Morris (Johnson & Morris), dealers in steam heating supplies, at 239 and 241 South Fifth avenue, New York, state liabilities $22,810, nominal assets $42,906, actual assets $37,159.

THE CITY COUNCIL of Circleville, Ohio, has passed an ordnance granting the franchise to the Circleville Steam Heating Company, to lay steam pipes in the streets for furnishing heat and power to the citizens. Work on the plant is to begin June 1, 1895.

A NEW CIRCULAR is received from the March-Brownback Stove Company, Pottstown, Pa., showing two views of their Crown water heater. It is of the dome type, with vertical circulation, and has a return flue. It has a 16 inch fire pot and is rated to carry 350 feet of radiation. The circular also gives a table as a guide for calculating the radiation required for buildings.

THE DWYER PLUMBING & HEATING COMPANY of St. Paul, Minn., with a capital stock of $20,000, have filed articles of incorporation with the Secretary of State. The incorporators are John J. Dwyer, Patrick H. Smith and John J. Bailey.

THE AMERICAN BOILER COMPANY will be represented in Illinois by Charles H. Straw, whose headquarters will be at Danville. T. J. Ryan of Milwaukee will represent the above company in Iowa, with headquarters at Des Moines.

THE MORTON TIN PLATE COMPANY, Cambridge, Ohio, started their plant on Wednesday, the 26th ult. These works, which consist of three hot mills, three cold mills and a complete equipment for producing black plates, have been previously described in the columns of *The Metal Worker*. The exceptional circumstances which favored the company during the construction period have continued. During the first three days of operations nearly 50 tons of plates of the best quality were rolled, and it is expected that shipments will commence during this week at the rate of 20 to 25 tons per day. In explaining their action in starting their mills upon a union basis, the company state that while there is little if any apparent margin for profit, they decided to pay the Amalgamated Association scale of wages in preference to incurring the trouble and expense of training inexperienced men, available non-union men not being of a desirable class. The plant was put in operation just four months and six days from the date on which ground was broken.

UNITED STATES IRON & TIN PLATE MFG. COMPANY, Demmler, Pa., expect to have their full complement of 12 tinning sets in operation by next week.

TIN PLATES.

Tin Plates in 1894.

THE PAST YEAR has not been one on which the tin plate trade can look back with any great degree of satisfaction. The trade shouldered its full share of the general business depression which prevailed throughout the United States, and was, moreover, under the spell of disturbing influences peculiar to itself, in the shape of tariff changes and labor difficulties, which will stamp the year 1894 as one of exceptional severity as regards this department. Until the final passage of the Wilson Gorman tariff law, in the middle of August, the trade was hampered and agitated by uncertainty respecting the proposed change in the tariff. When the new law was passed, reducing the duty on tin plates after October 1 from 2.2 cents to 1.2 cents per pound, sales dropped down to very small proportions. Consumers postponed buying beyond the limit of their current needs until they could take advantage of the expected drop in prices which would follow the changed duty, and the trade, for a month, was absolutely stagnant, so far as imported plates were concerned. After the opening of October prices of tin plates underwent a sudden drop, and a somewhat active demand sprang up, which was not, however, as extensive, either in volume or duration, as had been looked for. After a few weeks the trade relapsed into a condition of comparative dullness, which continued until the close of the year.

Reduced Consumption of Plates.

The fact that some of the largest consumers of tin plates closed their factories for a part of the year, and that about all ran them on a restricted scale, necessarily caused a material reduction in the value of tin plates used. The canning industry also passed through a year of unusual dullness, and the demand from this constituency has very largely contracted. Moreover, the inactivity in the building trades was reflected in a considerable decrease in the demand for roofing plates. To such an extent was this falling off felt that the importation of terne almost ceased for a time, the requirements of the roofers being fully met by the American manufacturers. After the new tariff became operative, however, Welsh roofing plates again made their appearance on the market, and a number of the smaller American "dippers," who had been turning these plates out in good quantities, were forced to close down their works altogether.

The Jobbing Trade.

The smaller consumers of both bright and terne plates have been supplying their wants throughout the year in a hand to mouth fashion, taking only such quantities of material as they required for actual use within a very short time, keeping no stocks at all, and expecting every time to be able to make their next purchase at a cheaper rate than the last—an expectation which has been usually justified by the event, the course of prices having been steadily downward from month to month. This peddling method of buying, involving frequent repetitions of orders, caused a kind of spurious activity among the jobbing trade, keeping them generally busy, but with a resultant aggregate of sales far below the volume generally secured with less effort. Altogether the reduced consumption of tin plates in the year just closed must have been very considerable. One of the largest dealers in this city places the falling off at 20,000 tons as compared with 1893—itself a dull year—and 40,000 tons as compared with 1892. The following table, furnished us by the firm referred to, shows a gradual dropping since 1890:

Estimated Consumption of Tin Plates in the United States.

	Tons of 2240 pounds each.
1890	320,000
1891	315,000
1892	300,000
1893	280,000
1894	260,000

The falling off has been most marked in the Eastern States, judging by reports received by us from importers and jobbers. A large firm of importers and dealers in New England place their decrease in the volume of sales at 40 per cent., as compared with the past two years. Another jobbing house in the same section state that their business from January to July was 20 per cent. behind, while from July to December it was between 10 and 15 per cent. less than that of 1893.

An Eastern firm, doing a large tin plate business, report that the volume of their business in the first half of the year was very largely behind that of the previous year, but that in the last half it was a little ahead, the total for the whole year being materially behind that of 1893.

This jobbing house refer to their business as showing a decrease of 10 per cent., owing, however, to lower prices, and not to a reduction in the volume of sales. A large Chicago concern also place their loss in trade at 10 per cent., while yet another in the same city state that their output was materially increased, while the gain in dollars and cents was practically the same as in the previous year.

Competition is generally referred to, both by manufacturers and dealers, as keener than ever, especially in foreign plates, while the margin of profit is uniformly reported to be much less than a year ago.

Prices.

Prices of Welsh plates have been gradually dropping during the year. When the new duty was imposed, on October 1, a sudden drop of from 75 to $1 a box occurred, and a further slight decline has developed since that time. IC, 14 x 20, coke tin plates of Welsh make, which, on January 1, 1894, were quoted in large lots at $5.35 a box, are now quoted at $4, and the end does not seem to be yet, although the lowest prices ever known have been long ago reached. American made tin and terne plates have generally followed suit in the reduction in price, but not to the same extent as the foreign material.

The Outlook.

As regards the prospects for tin plates in the present year, the views of the trade are generally hopeful for a greatly improved business. The impression seems to be that this improvement may not occur at once, but is likely to develop gradually in the course of the year as the existing wage difficulties on both sides of the Atlantic are straightened out.

On this subject a Boston house write as follows:

"It seems to us the prospects for 1895 are much more promising than they were for this year. We judge largely by the condition the manufacturers seem to be in, which appears to be one of great activity, although we have not as yet felt the effects of it ourselves. We think that since the change in the tariff on October 1 the demand for tin plates has increased and it seems liable to still further advance."

Another firm in the New England States allude to the effect of the new tariff as likely to be favorable as regards tin plates. "As the rate of duty is now fixed for a time," they say, "and American makers know what it will be and are increasing their output, the effect will be, we think, to increase the sales of American and reduce those of foreign plates."

From Columbus, Ohio, a leading tin plate firm write on the outlook in that city as follows: "Good, very good.

Half our trade is from this city and we know local demands will increase gradually, though prices, we believe, will be low." This opinion is supported by one of the largest New York importing houses, who anticipate a large business in 1895, but at close margins.

A Pittsburgh concern, doing a large business in that district, write: "We look forward to a very prosperous year. Here in Pittsburgh there is every indication of a large amount of building, and of a substantial kind. This will, of course, cause a greater volume of business in our line of roofing plates."

Chicago correspondents are more conservative in their estimates. One looks for only "a moderate improvement over 1894;" and another "hopes for a gradual improvement," but anticipates "no material increase for the next two years."

The new tariff, by lowering the cost of tin and terne plates, is generally held by jobbers to promise an increase in the consumption and consequently in the demand.

Collections and Credits.

Collections are generally reported as having been very fair. Many consumers, with poor facilities as regards cash and credits, have been obliged to withdraw from the field, and the balance have so well realized the need of conservative action that they have, as a rule, gotten their affairs in better shape than heretofore, and have been able to pay more promptly. In the West this appears to be specially the case. A Chicago house, doing a large jobbing trade in tin plates, say that their customers are, as a rule, in good condition to purchase and pay promptly for goods. The weaker concerns have been weeded out during the stringent times, and a safer trade is looked for.

On this head a Cleveland jobbing concern write as follows:

"We feel that our accounts contracted from now on, in fact, contracted for some time back, are safer than they would have been had we not had the severe depression. All buyers are more conservative, purchasing only what they actually need from month to month, which seems to enable them to meet their bills more promptly. Then the depression has weeded out a good many weak concerns."

And an old established Indianapolis firm of dealers refer to their collections as being greatly improved, 15 per cent. more of their customers discounting their bills than formerly. Their losses from bad debts, they add, were less last year than in any previous year.

In New York City and the Eastern States generally collections are reported to be fully as good, if not better, than formerly, owing possibly, in a measure, to the fact that stock and wages are so reduced that it does not require as much capital to pay for running expenses.

The Domestic Industry.

The growth of the American tin plate manufacturing industry during the year has been phenomenal, despite the repressive effect of a reduced tariff. The quarterly lists of the American works printed in *The Metal Worker*, and the long table of brands of American tin and terne plates now on the market, published herewith, will give some idea of the magnitude of this comparatively young native industry. During the last period for which official reports have been published—namely, the fiscal year ending June 30, 1894, the output of the American works was slightly under 140,000,000 pounds of commercial tin and terne plates. In the third quarter of last year the ratio of increase was undoubtedly proportionately greater, but the labor troubles, following on the reduction of duty on October 1, and the consequent cutting down of wages by the manufacturers, increasing the general closing down of the works, largely restricted the home production during the last quarter of the year.

The wage controversy between the manufacturers and the workmen is still unsettled, in spite of numerous efforts to effect an agreement, and the breach appears wider than ever. A number of the largest mills have already started up on a non union basis and others are preparing to do so. At the end of the year the output was generally increasing again, and it is likely that this quarter will exhibit a further increase in the aggregate output, as several large new mills, now building, are expected to commence operations within the next three months. The industry has taken so firm a hold in this country, and so much capital has been already sunk in it, that it is bound to override all obstacles and forge its way ahead, in spite of foreign competition and temporary impediments in the matter of wages and tariff.

New Works and Extensions.

The additions made to the list of American tin plate mills during the past year have been very numerous. Some of the new works are of the first magnitude, and all are provided with the most modern improvements in the way of tinning machinery and labor-saving apparatus. Probably, at this time, America can show some of the most completely equipped tin plate mills in the world. A few of the smaller dipping plants have gone out of existence as a result of adverse tariff legislation, but the larger works of that kind have stood to their guns and are still turning out large quantities of tin and terne plates, having continued in operation even when the works attached to rolling mills were closed down. None of the larger concerns, notably those manufacturing their own black sheets, which form, of course, the backbone of the industry, have gone out of existence. A large number of concerns have increased their size and capacity by the erection of larger buildings, or by the provision of additional rolling mill or tinning machinery. Some of the original works have been remodeled, in order to adapt them more fully to modern requirements, and a few dipping works have added rolling mills to their plants.

A new and satisfactory feature in the industry is found in the fact that a number of iron making firms have put up or are now building tinning works as an adjunct to their mills. Such has been the case with the Ætna-Standard Iron & Steel Company, at Bridgeport, Ohio; the Canonsburg Iron & Steel Company, at Canonsburg, Pa.; Hughes & Patterson, at Philadelphia; the Old Dominion Iron & Nail Mfg. Company, Richmond, Va., and Lalance & Grosjean Mfg. Company, at Harrisburg, Pa. Among the most recent large plants are those of the Morton Tin Plate Company, Cambridge, Ohio; the Irondale Steel & Iron Company, Middletown, Ind.; Montpelier Sheet & Tin Plate Company, Montpelier, Ind.; the Britton Rolling Mill Company, Cleveland, Ohio, and the Atlanta Steel & Tin Plate Company, Atlanta, Ind., all of which are on the most extensive and substantial scale.

At the present moment some six or eight large tin plate mills are being erected, including those of the Beaver Tin Plate Company, New Lisbon, Ohio; Crescent Sheet & Tin Plate Company, Cleveland, Ohio; Globe Tin Plate Company, Newcastle, Ind.; Goldsmith & Loewenberg, New Kensington, Pa.; La Belle Iron Works, Richmond, Va., and the National Tin Plate Works, Anderson, Ind. All these new works are expected to be in full operation within the next six months, and they will form a very strong addition to the productive capacity of the country.

Quality of American Plates.

The American works are producing both tin and terne plates in all sizes and grades, of a quality equal, and in some instances very superior, to those imported from abroad. The home consumers are becoming largely convinced of the merits of the native plates, and —particularly in the West—are reported to be discarding the use of the foreign article entirely. The American roofing plates have for some time past firmly established their reputation. Many brands of these plates are now almost as well known throughout the United States as the old Welsh standard brands. The bright plates are now coming more and more to the fore, and are by degrees displacing the Welsh material in certain sections.

Views of Manufacturers.

In regard to the outlook for the American tin plate industry, we present herewith extracts from some of the re-

(*Continued on page* 44.)

List of American Manufacturers of Tin and Terne Plates and Their Brands.

JANUARY 5, 1895.

Name of manufacturing firm.	Location of works.	Tinning sets. No.	Tinning sets. In operation	Whether rolling black sheets.	NAMES OF BRANDS. Bright tin plates. Charcoal.	Bright tin plates. Coke.	Terne plates.	REMARKS.
Ætna-Standard Iron & Steel Co	Bridgeport, Ohio	3	....	Yes.	Ætna	Ætna	Belmont, Belmont Special, Belmont Extra.	
American Tin Plate Co	Elwood, Ind	15	10	Yes.	Elwood. Leeds	Elwood	Elwood, Indiana.	
American Tin & Terne Plate Co	Philadelphia, Pa.	....	....	....				
American Tin Plate Machine & Mfg. Co.	Linfield, Pa	4	4	No.			* Linfield, * Tandem, Barto, Ætna, Merlon, Mingo, Saratoga, Pencoyd	* Continuous roofing.
American Stamping Co	Brooklyn, N. Y.	....	....	No.				Make bright plates for their own use only.
Apollo Iron & Steel Co	Apollo, Pa.	6	1	Yes.			Apollo Best Roofing.	
Atlanta Steel & Tin Plate Co	Atlanta, Ind.	8	4	Yes.	Atlanta	Atlanta	Atlanta.	
Baltimore Steel, Iron & Tin Plate Co.	Baltimore, Md.	....	....	Yes.				Reconstructing and enlarging works.
Beaver Tin Plate Co.	New Lisbon, Ohio	....	....	†				Building.
Black Diamond Tin Plate Works.	Philadelphia, Pa.	4	4	No.	Arrow, Black Diamond, Horse Shoe, Imperial, Peerless	B ◇ D Coke	Arrow, Black Diamond, Horse Shoe, Laurel, Quaker City.	
Blairsville Rolling Mill & Tin Plate Co.	Blairsville, Pa.	5	....	Yes.				
Britton Rolling Mill Co	Cleveland, Ohio	3	....	Yes.	Britton's Best Buckeye, Britton's Buckeye	Buckeye Coke	B. B. B. Roofing, B. B. Roofing, B. Roofing.	
Canonsburg Iron & Steel Co	Canonsburg, Pa.	3	....	Yes.	Flag		Down	Operation temporarily suspended.
Chicago Stamping Co	Chicago, Ill.	5	5	No.				Make bright plates for their own use.
Cincinnati Corrugating Co	Piqua, Ohio	1	1	No.			Piqua.	
Crescent Sheet & Tin Plate Co.	Cleveland, Ohio.	....	....	†				Building.
Duquesne Tin Plate Works	Pittsburgh, Pa.	5	5	No.			Iron City, Soho.	
East River Lead Co	New York, N. Y.	2	....	No.				Operation suspended.
Ellwood Tin Plate Co	Ellwood City, Pa.	....	....	Yes.				About to commence operations.

(*Continued from page* 41.)

ports with which we have been favored by the domestic manufacturers:

An Ohio manufacturer writes as follows:

"As the wage question in tin mills has not been settled, the prospects of doing business in the early part of the new year are not promising. We think, however, that there will be a fair amount of business by spring, increasing as the year grows older, provided capital does not get scared at the agitation of new financial schemes. We do not anticipate having what we call 'good business' until some time during '96, and possibly not until '97 has shown its colors. The improvements in tin plate manufacture, that is 'individual improvements,' have been minor. Being a new industry, improvements have been general, more especially in general arrangement, concentrating the different departments to save labor as much as possible, and thus lessen cost of production."

An Eastern manufacturer gives it as his opinion that business in his line in the early spring will be very brisk. The new tariff, he remarks, has somewhat demoralized the industry, as Welsh competition is giving the manufacturers all they can do to hold their own, but this difficulty they expect to overcome in time. He adds that he is continually experimenting in order to reduce costs, and has been able during the past year to do so in several directions.

A manufacturing firm in Philadelphia remark:

"The tariff has had the effect of reducing prices and, what is worse, bringing in inferior plates of every conceivable weight except the standard. It has also stimulated us to put in more improved machinery by which we can meet the reduction."

In regard to the outlook for American tin plates, the writers say:

"We consider the prospects for 1895 very favorable, for the reason that the brands of American plates are becoming better known and are being ordered in increasing quantities in preference to foreign. This being so, especially for the last six months, we naturally look for a still greater improvement in this direction, as the foreign article is certainly deteriorating in quality and finish to meet competition."

An Ohio concern manufacturing bright tin plates write to the following effect:

"We have spent six weeks visiting our trade and getting the pulse of business, traveling nearly 5000 miles during that time, and having interviews with some of the foremost business men of the country. The generally hopeful feeling of the trade is apparent in almost every direction, although every one is feeling that profits are not commensurate with the efforts that are required to obtain business; nevertheless, there is a larger volume of business than heretofore, and every one feels, as far as our observation goes, that the coming year offers a much more hopeful outlook than a year ago. The cost of production to manufacturers, while it has been reduced by lower material, yet there is a demoralizing condition of the market which has caused a much greater decline in the price of their production than the cost would warrant, and we feel that if trade revives there must be a reaction, to a certain extent, in the recovery of prices, though that may be some time in the future. There is one point that is largely against the manufacturers of tin plate in this country, and that is the co-operation of the steamship lines

with our railroads, making Western deliveries almost on a par with seaboard deliveries. The Detroit, Chicago and Western shipping points are contracting for foreign tin to be laid down in their cities at a much less rate of freight than is charged by our railroads from the seaboard to these points. This is a great discrimination on the part of the railroads to encourage foreign shipments and a great drawback on our tin plate industry."

One of the largest manufacturing firms in this country, located in Ohio, report a very favorable trade up to October 1, when their works were closed down on account of the new tariff and pending adjustment of wsges. They regard the outlook as fair, and are among those who have decided to run their plant non-union, which they expect to be able to do with little difficulty.

Improvements in Manufacture.

Great strides have been made during the past year in the directlon of improvements in tin plate machinery and in the general appliances connected with the industry. The American genius for inventing has evolved some remarkable labor-saving machinery, and new tinning machines, pickling machines and apparatus for handling, cleaning, polishing and even sorting and packing the plates have been among the developments of the year for which patents have been applied and awarded. New processes for facilitating manufacture and improving the product are being constantly adopted in all the works.

Tin Plate Machinery.

Several firms have embarked in the manufacture of tin plate machinery as a specialty, and the industry has already become a very important one. These firms have all enjoyed an excellent business during the year in ministering to the needs of the numerous manufacturing concerns that have been building or adding to their plants.

American Black Plates.

The number of tin-plate plants that manufacture their own black plates has grown materially. Nearly all the latest additions to the list of American makers combine the two lines, while a large number of rolling mills have added, or are adding, tin mills for the production of plates for tinning purposes. The quality of the American black plates is admittedly excellent, and these are unlformly preferred by the dipping firms to the foreign material. Latterly the alteration in the duty on tinned and black plates has made the use of the domestlc plates almost prohibltive to those manufacturing firms who do not roll thelr own material, and they have been forced, for economy's sake, either to revert to the use of imported plates or to shut down altogether. This diffi culty soon may, and probably wlll, be surmounted when the wage question is settled and the manufacturers are able to reduce the price of Amerlcan plates through reductions in the price of labor and the adoption of more economical processes, although black plates are already down to the lowest price known.

A number of iron and steel mills have erected tin mills during the year, and the production of black plates for tinning is likely to be immensely augmented this year. So far, the supply has been hardly adequate to the demand, and in the busiest quarter of last year—that ending September 30—the complaint was often heard from the tin plate makers of inability to obtain a sufficient supply of black plates to keep their works running as actively as their volume of orders necessitated. This drawback will probably not be again felt.

The use by the tin plate makers of black plates rolled in the United States, in place of the imported article, has grown substantially, and at the present time it is estimated that 75 to 80 per cent. of American tin and terne plates are made from American steel and iron sheets. Colonel Ayer's last report, for the quarter ended June 30, 1894, gave 73 per cent. as the proportion at that time.

Palm Oil.

Through the first effect of the new tariff law on the tin plate industry, there was some falling off in the volume of business done in palm oil. For the past six months, however, there has been about double the trade of the last six months of 1893, and as the demand has taken on some degree of strength, competition has correspondingly increased, with a tendency to reduce the margin of profit.

The Tin Plate Market.

We print, in conclusion, an interesting memorandum on the tin plate market for the past year, issued by the old and well-known firm of Bruce & Cook of this city, which contains a review of the situation from the jobber's point of view. They write, on January 1, 1895, as follows:

The history of the tin plate market during 1894 was a gradual decline in price by makers, and a sudden drop October 1, when the new rate of duty took effect. The very low prices obtaining for steel and pig tin have made possible the lowest prices on tin and terne plates ever known, and this with a duty of $1.20 per 100 pounds, or about 50 to 60 per cent. of the present value of plates used by canners and terne plates used for roofing. The causes for this decline may be found in the overproduction of steel, and under improved methods at low prices—the low prices for pig tin, owing partly to the low rate of silver, and the operations of a tin syndicate and those opposed to it. As labor, steel and fuel are by far the most important items entering into the cost of tin plate, any change in these may be taken as a sure and quick guide as to future value of plates.

A comparison of prices ruling in the latter part of December in large lots may be of interest:

	1894.	1893.	1892.	1891.	1890.	1889.
Steel rails, per ton	$22.00	$24.00	$30.00	$30.50	$28.50	$34.00
IX pig iron, per ton	11.25	13.50	14.25	16.00	16.00	18.00
Straits tin, per ton	314.00	465.00	440.00	448.00	454.00	470.00
Straits tin duty, per ton	Free.	89.60	89.60	Free.	Free.	Free.
Pig lead, per ton	72.00	74.00	84.00	95.00	92.00	88.00
IC 14 x 20 coke tin, per box	4.00	5.35	5.38	5.35	5.20	4.80
IC 14 x 20, duty, per box	1.29	2.36	2.36	2.36	2.36	1.07
Import price, less duty	$2.71	$2.99	$3.02	$2.99	$2.84	$3.73

The resources of this country are very great for almost every known commodity and, for many of them, far exceed those of any other country. Our home market is an exceedingly large and important one and should be served by producers on terms as favorable as to any other, but we should not be content with this alone. We must do an international trade, and to do this we must give our producers and manufacturers the best market to buy in. We must be a nation among nations, able to reach the best of the world's markets for both buying and selling, but, above and beyond all, we must have a system of currency and finance not useful in our own country alone, but available the world over. A United States dollar should be such that it will be recognized and accepted for a dollar value at sight, wherever or whenever seen. No other kind should be issued. As "no man liveth to himself," so it will be with nations. We hope for wise legislation at Washington on the currency question, and with as little delay as is consistent with wisdom.

Values do not usually remain at the lowest point very long. We believe that they are there now, and that there are evidences of a better demand, a revival of industries, after nearly two years of prostration. Let those who guide labor and those who control capital study each other's interests, work in harmony for a common end, and we are sure the trade of the country will right itself, giving to all honest men an honest return for honest labor.

The Coal Mining Situation.—The joint convention of coal operators and miners of the Pittsburgh district, held in that city on Friday, the 28th ult., adjourned without reaching a settlement of a wage rate to be effective until May 1 next. The question was left to a committee consisting of three operators, three miners and three disinterested citizens of Pittsburgh. This committee is expected to meet in conference in about two weeks, and in the mean time the district rate for Pittsburgh will remain at 55 cents, the price adopted by the Railroad Coal Operators' Association. John Burns, M. P., the well-known labor leader of England, and M. M. Garland, of the Amalgamated Association, were both present at the above conference.

Plans for nearly 2600 buildings, at an estimated cost of $51,300,000, have been submitted in New York City during the past year, a slight increase over 1893, if the Cathedral of St. John the Divine be excluded.

STOVE TRADE NOTES.

The Stove Trade of 1894.

BY GEO. W. COPE.

Review of the Year.

STOVE MANUFACTURERS should congratulate themselves that the worst year known in recent times is over. With no absolute certainty as to the developments of the future, they can at least hope that 1895 will show a material increase in the volume of business. And it is entirely reasonable and in accordance with natural laws that this should be the case. The year following a severe financial panic is always a period of depression, for recuperation is a slow process. It is estimated that the trade of 1894 in regular lines of coal and wood stoves was about one third less than that of 1893. This is due to the very light sales in the first six months of the year, as compared with the excellent demand in the corresponding period of 1893. It must be borne in mind that the panic of the latter year occurred in June. Hence the latter half of 1893 felt its brunt, and genuine recovery did not set in until 1894 was well spent. The improvement in the last few months of the year was not sufficient to compensate for the dullness of the first part.

The trade reports published in our columns from time to time during the year very accurately set forth the prevalence of these conditions. New England, New York, Philadelphia, Baltimore, Cincinnati, Chicago and St. Louis substantially agreed that the first quarter of 1894 showed but slight recovery in their several sections. Each month marked a little gain over that preceding, but the increased business was not enough to restore even a semblance of activity for either manufacturers or merchants. Stove foundries ran spasmodically. There were frequent reports in our news items of foundries starting up, only to be followed in a short time by statements that the same foundries had been obliged to shut down until accumulated stocks could be worked off. Manufacturers with plenty of capital, or with facilities for securing the necessary money, ran steadily on short time to enable their workmen to live, even though warehouses were filled to overflowing, showing themselves practical philanthropists.

The second quarter of the year was but little better than the first. New England reported a very conservative feeling among dealers, who were unwilling to increase their trade by selling stoves on credit to workingmen on short time and reduced pay. New York admitted that a demand which set in on the opening of spring had been short lived. Philadelphia found more business doing, but most buyers hesitating about placing orders in advance of their actual requirements. Chicago testified to an intermittent trade, varying from satisfactory orders in exceptionally prosperous localities to no demand whatever in sections still suffering from business prostration. St. Louis appeared at this time to be in best shape, having been benefited by cut freight rates to outlying districts, during the prevalence of which the St. Louis manufacturers and merchants had been able to reduce their stocks. June saw many Western foundries compelled to suspend operations on account of the coal miners' strike, which cut off their supply of coke. The shortage of coal was for a time so serious that it caused a little boom in gasoline and oil stoves in the very heart of the Western coal mining regions. July was dull in the East, but fairly active in the West, where the approach of harvest, with its prospect of ready money then in farmers' hands, gave dealers more courage to order stocks. But August saw blighted hopes, as the July railroad strikes had injured general business, checking the operations of innumerable local industries, while nature joined forces with man to ruin the trade by the prevalence of scorching winds, which burned up vegetation over a wide expanse of country in the West. Disheartened merchants countermanded their orders.

September and October, however, witnessed a decided change, particularly in the West. It was found that only Western Kansas and Nebraska and portions of South Dakota were actually suffering from crop failures due to drought and hot winds. Iowa, being an older State, with farmers who had enjoyed many years of prosperity, proved itself superior to one season of short crops. Other Western States were blessed with good crops, and the Southwest was particularly well favored. Hence the demand for stoves assumed something of its old-time activity, being far better than for the corresponding period of 1893. November was, in the main, an excellent month, but the weather was unseasonably mild, causing a falling off in the demand for heating stoves. December was a quiet month, as usual, trade being confined to small shipments to meet the requirements of dealers with occasional customers.

Several features of the trade of 1894 call for special reference. It was a hard year on traveling salesmen. So many uncertainties clouded the business sky that dealers placed very small orders, and then only when they were positively certain that they could sell the goods. Hence, salesmen were obliged to canvass their districts frequently, so as to be sure to catch the dealer ready to buy. Another feature was the great demand for stove repairs. All sorts of odd castings were called for, some of which had not been in demand for years, showing that parts of stoves were being renewed which in good times would cause owners to discard the stoves and buy new ones. Large stove companies found their repair department a much more important source of revenue than ever before. Irregularity in prices became a fruitful source of annoyance in some localities, owing to the ambition of some manufacturers to extend their trade, regardless of the absolute certainty that they would only reap a temporary advantage from the inauguration of such a policy. If it had been continued it would have merely resulted in the lowering of competitors' prices, so that the last stage of the trade would have been worse than the first, because nobody would have increased his volume of business, but would, perhaps, have sacrificed all his profits on his still meager sales. Another interesting feature was the continued growth of the business in steel ranges. It is believed that more of these were sold in 1894 than in any previous year, as prominent manufacturers, making steel ranges a specialty, were frequently considerably in arrears on deliveries. The manufacturers of oil heating stoves also did well, as compared with previous years, their circle of consumers steadily widening.

Freight Questions.

In connection with the course of trade the subject of freight rates comes up very closely. Several important developments took place in this line during the year. The Southern manufacturers suffered seriously by the imposition of prohibitory rates on stoves to Northern points in the latter part of 1893. Several of the Southern foundries had until then enjoyed an outlet in Northern markets which was of much importance to them, but this was suddenly cut off, and the loss of trade was

so great that they were compelled to shut down. The manufacturers used their utmost endeavors to have the rates reduced, but it was not until the latter part of September, 1894, that they were successful. The importance of the reduction may be seen from the statement that the charges per hundred pounds from Chattanooga to Cincinnati were changed from 47 cents to 19 cents. The Western stove manufacturers also had their bit of experience of a slightly different character. In November they learned that the Western Classification Committee of the railroads had decided that after January 1, 1895, the classification on stoves in less than carload lots should be raised from third to second class, and, at the same time, the minimum weight of a carload should be increased from 20,000 pounds to 24,000 pounds. The change thus ordered involved an advance of 25 to nearly 50 per cent. in the rates of freight on all Western business. It was the unanimous opinion of the stove trade that conditions did not warrant any advance in freight rates. The cost of stoves to Western consumers would thus be so enhanced as to threaten a serious restriction of the demand. Efforts were accordingly made at once to induce the railroad companies to rescind their action. So much pressure was brought upon the managers by manufacturers and merchants that a special meeting of the Classification Committee was called in December, at which the new classification was reconsidered and the old one restored, with the understanding that no change shall be made for at least the next six months. On December 1 lower freight rates on stoves were established from Louisville to Southern points, in compliance with the requests of Louisville manufacturers. Another movement is now on foot to secure the reduction of freight rates in Illinois, which have for a long time been higher than those prevailing in neighboring States, and have thereby operated as a discrimination against the local manufacturers in endeavoring to secure trade in their own State. These occurrences show the importance of the subject of railroad freight rates as a topic for permanent consideration by local stove associations as well as the national body.

Meetings of Associations.

The event of the year in gatherings of manufacturers was the twenty-third annual convention, which was held at the Auditorium Hotel, Chicago, on May 2 and 3. The occasion was one of the most interesting in the history of the National Association of Stove Manufacturers. An unusual number of exceedingly practical papers was read, and the discussions were animated and instructive. At this meeting it was resolved that current prices and terms on stoves should be firmly maintained during the year 1894, in the best interests of manufacturers, dealers and labor. The following officers were elected for the ensuing year:

President, George D. Dana, St. Louis.

First vice-president, Lazard Kahn, Hamilton, Ohio.

Second vice president, Francis Kernan, Utica, N. Y.

Treasurer, W. S. Stevenson, Philadelphia.

Secretary, D. M. Thomas, 80 Broadway, New York.

Board of Management, H. W. Buttorff, Nashville, Tenn.: Henry Cribben, Chicago; C. A. DuCharme, Detroit; Frederick Will, Rochester, N. Y., and W. E. Walker, Taunton, Mass.

The Stove Founders' National Defense Association held their annual meeting at the same place, on the day previous to the meeting of the National Association, and re-elected the old officers, headed by Henry Cribben of Chicago as president. Harmonious relations with workmen were reported, and the proceedings were consequently of a routine character.

A meeting of Southwestern Stove Manufacturers was held at the Southern Hotel, St. Louis, on August 20, and was attended by representatives of all the foundries of St. Louis, as well as many of those in Southern Indiana and as far south as Memphis, Tenn. Questions of important local interest were considered. Another meeting was held at the same place on November 7 and 9, which was even more numerously attended, and by manufacturers from a wider scope of territory. Steps were taken toward the formation of a Southwestern Association, to meet bi-monthly or quarterly, to regulate local matters and to act in harmony with the National Association.

At the Grand Hotel, Cincinnati, December 4 and 5, an important meeting was held which was attended by a considerable number of the most prominent stove manufacturers of the West and Southwest. Action was taken upon the proposed reclassification of stoves by railroads, and efforts were made to harmonize differences between Northwestern and Southwestern manufacturers, while prices were also discussed to some extent. Much business was put in shape for final consideration at the next annual convention of the National Association.

New Patterns and Designs.

Notwithstanding the general dullness in the stove trade, enterprise was not completely checked. Many manufacturers brought out new patterns with which to coax needed dollars from reluctant pockets. Popular constructions, which had been on the market for some time and had lost their novelty, were redressed in order to awaken fresh interest. Less was done in this way than in previous years of activity, but it is noteworthy that so much was done at a time when economies of all sorts were being enforced to reduce running expenses of manufacturing. Some classes of stoves, which had been previously made by a very few, were brought out by others in order to catch the rising breeze of public favor. Among these is the cast iron air tight stove for burning soft coal, which has been remarkably successful the past year, due very probably to the enforced economy prevailing among the general public, which has led in the West to the substitution of cheap soft coal for the much dearer anthracite, but compelled the use of a different type of stove. Sheet iron air tight stoves have also been brought out for wood, being further adapted to the use of chips, cobs, bark, &c., and therefore have met with a wide sale in many portions of the country, owing to their low first cost and their adaptability to cheap or refuse fuel. Phenomenal sales are reported of these sheet iron wood heaters. Great progress has also been made in the construction of stoves specially designed to burn straw and hay, and therefore in much favor on the treeless plains of the Northwest, which are also long distances from coal deposits. Greater success has also been attained in the construction of stoves for burning lignite, which is found so abundantly in some parts of the Rocky Mountain region, but cannot be burned to advantage in stoves of ordinary construction.

Improvements in Plant.

Considerable capital has been invested during the year in providing better manufacturing facilities, rebuilding burned foundries, enlarging warehouses, improving office accommodations, &c. Among the most important improvements of this character in the stove and allied trades are the following:

The Auburn Stove Foundry Company of Auburn, Maine, rebuilt their works, which were damaged by fire in 1893.

The Excelsior Steel Furnace Company of Chicago removed into much larger quarters at 38 and 40 West Monroe street, where they occupy a five-story and basement building in the manufacture and storage of furnace fittings, furnaces, boilers, &c.

The Bridge & Beach Manufacturing Company of St. Louis demolished their old foundry, which had been in use since 1848, and erected a seven-story building, extending from Main street to the levee. It is equipped throughout with the latest improved machinery of the most approved design.

The Glazier Oil Stove Company of Chelsea, Mich., built an important addition to their works.

The Michigan Vapor Stove Company of Grand Rapids, Mich., removed into a much larger building, to meet the requirements of their growing trade.

F. Meyer & Bro. Company of

Peoria, Ill., largely increased their capacity for manufacturing furnaces.

The Spicer Stove Company of Providence, R. I., made important additions to and changes in their foundry, adding greatly to the convenience of the plant as well as increasing their facilities for production.

The Warren Hardware Company of Warren, Ohio, erected a new building for the manufacture of steel ranges, enabling them to materially enlarge their output.

W. M. Crane & Co., 838 Broadway, New York, increased their facilities for the manufacture of hotel and restaurant cooking appliances.

The Detroit Stove Works completed one of the finest stove warehouses in the country at 2921 to 2929 La Salle street, Chicago.

The Coldwater Oil Stove Company, Coldwater, Mich., greatly enlarged and improved their plant.

The Front Rank Steel Furnace Company of St. Louis took possession of much larger quarters at 705 and 707 North Main street.

The William Miller Range & Furnace Company of Cincinnati erected a much larger building at Seventh street and Broadway, to accommodate their increasing business.

Cribben, Sexton & Co. of Chicago built a very fine office and warehouse at 52 to 56 Erie street, immediately adjoining their foundry, and removed their sales department to it from Lake street, where they had been for 20 years.

The Hood Furnace & Supply Company of Corning, N. Y., rebuilt their plant for the third time in their history, greatly enlarging their facilities, which are exclusively employed in the manufacture of warm air furnaces.

The Thomas White Stove Company of Quincy, Ill., added a five-story brick building to their works, to be used as a mounting shop and for storage.

The Channon-Emery Stove Company of Quincy, Ill., built a brick boiler and engine house and a four-story brick building to be used for cleaning, mounting and trimming. They also put in a new nickeling plant.

Rathbone, Sard & Co. of Aurora, Ill., erected a large addition to their already immense warehouse, greatly increasing their facilities for making prompt shipments of stoves during the busy season.

The Rock Island Stove Company of Rock Island, Ill., put up a model office building, two stories in hight, of red brick with stone trimmings, the ground floor to be used as a sample room.

Floyd, Wells & Co. of Royersford, Pa., made extensive improvements in their foundry.

The Favorite Stove & Range Company of Piqua, Ohio, added a great deal of new machinery to their equipment.

The Lexington Foundry Company of Lexington, Ky., erected a large wareroom building for storing patterns, &c.

The Thatcher Furnace Company of New York removed to a much larger warehouse and salesroom at 240 Water street and made numerous improvements in their plant at Newark, N. J.

The Ireland & Matthews Manufacturing Company of Detroit, Mich., have erected an additional three-story building for the purpose of increasing their manufacturing facilities, being large makers of stove trimmings and ornaments.

New Companies.

Among the new establishments launched this year in the stove trade or kindred lines are the following: The Ferrosteel Company of Cleveland and Chagrin Falls, Ohio; the Evansville Stove Works of Evansville, Ind.; the Rapid Transit Stove and Furnace Company of Baltimore, Md.; Cole & Cole of Omaha, Neb.; the Standard Range Company of Evansville, Ind.; the Cincinnati Steel Range Company of Cincinnati, Ohio; the Mobile Stove and Novelty Works of Mobile, Ala.; L. G. Comparet of Des Moines, Iowa; the Schaab Puff Stove Company of St. Louis; the Home Stove Company of Indianapolis, Ind.; the Beaver Falls Heating and Ventilating Company of Beaver Falls, Pa.; the Detroit Galvanizing and Sheet Metal Works of Detroit, Mich., as makers of sheet iron stoves; the Simmons Hardware Company of St. Louis, as makers of sheet iron stoves; the Hagey Stove Company of St. Louis; Ferris & Sons of St. Louis; A. Ohnemus & Bro. of Quincy, Ill.; the Manchester Stove Company of Manchester, Ohio; the Bly Gas Burner Company of Sioux City, Iowa; the Queen Stove Company of Denver, Col.; the Economy Gas Stove Company of Decatur, Ill.; the Marion Heating Company of Marion, Iowa; the Plymouth Stove Company of Boston, Mass.; the Western Stove & Manufacturing Company of Milwaukee, Wis.; the Dayton Manufacturing Company of Dayton, Ohio; the Chicago Gas Stove Manufacturing Company of Chicago; Moore Brothers of Wichita, Kan.; the Conover Fire Place Manufacturing Company of New York; the St. Louis Gas Radiator Company of St. Louis; the Ryns Hot Air Heating Company of Kansas City, Kan.; the Galusha Stove Company of Rochester, N. Y.; the Lansing Co-operative Stove, Furnace & Fuel Company of East Lansing, Mich.; the Albany Facing Mill Company of Albany, N. Y.; the Eclipse Stove Company of Rockford, Ill.

Business Changes.

Head's Iron Foundry of Utica, N. Y., was succeeded by Giblin & Co.

The Security Gas & Vapor Stove Company of St. Louis were succeeded by L. B. Jones as manufacturer of the Security gas stove.

The business of E. D. Ransom & Co. of Albany, N. Y., manufacturers of foundry facings and supplies, was sold to the Albany Facing Mill Company.

The A. C. Barler Mfg. Company succeeded the Huette-Barler Mfg. Company of Chicago, makers of Barler's Ideal oil heater.

The Bridgeport Stove Works Company succeeded Lowman Brothers of Bridgeport, Ala.

Bramhall, Dean & Co. of Chicago were succeeded by Dean, Huot, Brooks & Moneuse Company.

The Bain Stove Company of Charleston, Ill., failed.

The Central Stove Works were incorporated at Lebanon, Pa., to succeed Forster Brothers.

E Bement & Sons of Lansing, Mich., purchased the business of the Wilcox Heat Light Company of Grand Rapids, Mich.

The Bennett & Peck Heating & Ventilating Company of Cincinnati changed their name to the Peck-Williamson Heating & Ventilating Company.

The Rogers Stove & Foundry Company of Belleville, Ill., failed.

The Simonds Mfg. Company of New York passed into a receiver's hands.

The business of the Baxter Stove Company of Mansfield, Ohio, was divided, the Monarch vapor and gas stoves passing under the control of the Monarch Gas & Vapor Stove Company.

The Raymond & Campbell Mfg. Company of Middletown, Pa., passed into receivers' hands.

The Chicago Stove & Range Company bought the stock and business of the Chicago branch of the Sill Stove Works.

Fires.

On February 10 the works of E. Bement & Sons, at Lansing, Mich., were damaged to the extent of about $10,000; on the 18th the Glazier Stove Company of Chelsea, Mich., lost their warehouse and offices; on the 19th Hess, Snyder & Co. of Massillon, Ohio, lost their pattern storehouse; on the 25th the works of the Bloomington Stove Company of Bloomington, Ill., were practically destroyed; on April 5 the Baxter Stove Company of Mansfield, Ohio, suffered the loss of their storage warehouse; on May 28 the Kibler Stove Works of Denver, Col., lost a portion of their patterns; in June the foundry and pattern shop of Bridgeford & Co. of Louisville, Ky., were destroyed; on July 2 the large warehouse of Stratton & Terstegge of Louisville, Ky., was burned; on July 8 the factory of the Quick Meal Stove Company, at St. Louis, was partially destroyed; on September 1 the foundry of Cribben, Sexton & Co. of Chicago was slightly damaged; on September 3 the Van Wie Gas Stove Works, at Rockford, Ill., were completely burned; in the same month the works of the Memphi Stove Company of Atlanta, Ga., were partially burned; on Sep-

tember 25 the foundry of the Gladiator Stove Works, at Russell, Ky., was destroyed; in October the Cleveland Foundry Company of Cleveland, Ohio, were burned out, the plant being leased from the Cleveland Co-operative Stove Company; in November the foundry of George Harbly & Sons, at Russell, Ky., was destroyed.

A Few Items of Interest.

The Anshutz Bradberry Company of Pittsburgh celebrated in 1894 the fiftieth anniversary of the establishment of their business. In 1792 the first blast furnace west of the Alleghany Mountains was erected at Pittsburgh by George Anshutz, an uncle of the founder of the firm. The name is thus indelibly connected with the iron history of the famous Iron City.

In April the Sharon Stove Works of Sharon, Pa., delivered a stove to a customer in six hours from the time the pig iron was melted for it in the foundry cupola.

George H. Barbour of the Michigan Stove Company, Detroit, will be long remembered by the poor of that city for his indefatigable work in the winter of 1893-94 in relieving their necessities.

B. W. Dodson, for years permanently identified with the stove business, retired from it in 1894. He was last connected with the Detroit Stove Works as second-vice-president in charge of their Chicago branch.

John Keyser, a veteran stove manufacturer of New York, retired from business July 1, having spent 55 years of his life as a manufacturer of stoves and furnaces and an inventor.

The Indiana Stove Works of Evansville, Ind., put in force a plan for the benefit of their regular employees in case of sickness or accident. The sum of $1000 was set aside for this purpose, to be drawn upon under certain stipulations, married men to receive $5 per week, unmarried men $3 and apprentices $2.

Deaths.

The death roll for 1894 includes a number of prominent names. In January George W. Gardner, manufacturer and inventor, died at Troy, N. Y.; Robert White, an old employee of Rathbone, Sard & Co., died at Utica, N. Y. In March George H. Pickering, a veteran traveler in the employ of the Spicer Stove Company, died at Providence, R. I.; Samuel Freeman, long connected with the Magee Furnace Company, died at Boston. In April Anson Ingraham, for years a stove manufacturer at Troy, died at Center Cambridge, N. Y. In June William W. Corner, who had also been a manufacturer at Troy, died at Poughkeepsie, N. Y.; B. C. Bibb, president of the B. C. Bibb Stove Company of Baltimore, Md., died at Baltimore. In August Frank F. Proctor, secretary of the Culter & Proctor Stove Company, died at Peoria, Ill.; Jesse Reynolds, senior partner of J. Reynolds & Son, died at Philadelphia. In September Amos C. Barstow, president of the Barstow Stove Company, died at Providence, R. I.; Benjamin Carver of the Grander Stove Works, died at Royersford, Pa.; Charles F. Whiting, long in the stove trade and latterly a salesman for Eugene Munsell & Co., died at Orange, N. J. In October Will Stork, a well known stove salesman in the employ of the Portsmouth Stove and Range Company, died at Portsmouth, Ohio. In November Robert Diven, one of the oldest stove men in New York, and for nearly forty years connected with the J. L. Mott Iron Works, died in New York; James B. Taylor, long a confidential employee of the Richardson & Boynton Company, dled in Brooklyn. In Decemben Norman H. Galusha, long a prominent manufacturer, died at Rochester, N. Y.; J. Emery Eaton, for a number of yesrs president of the Syracuse Stove Company, died in New York.

Opinions from the Trade.

As the new year opens and the accounts for the past 12 months are closed, the members of the trade naturally turn their thoughts to the outlook for the future. As conditions are not the same in all sections, it is not surprising that there is a diversity of opinion in the trade as to the volume of business likely to be transacted during 1895. In the light of the reports from stove manufacturers of the country it appears that the majority consider the outlook for business during the next few months as far from encouraging, although an improvement is regarded likely in the near future. In those sections where the crops have been poor or practically a total failure, thus seriously reducing the purchasing power of consumers, a poor business is expected until the fall, when trade will be better than for the corresponding period of last year. In other sections the outlook for spring trade is said to be better than a year ago, but it does not seem likely that prices will show any advance. There are a few who consider the prospect for the new year fairly good, and although at the moment there is very little on which they can intelligently base a forecast, they express a hope of better times before long.

A manufacturer in the Eastern section of the country writes that, "based upon the state of trade the past few months and the reports from the traveling men, the prospects are not encouraging, and we shall be slow to make up stock." Another concern, who take a little more hopeful view of the situation, write as follows: "Prospects are good for 1895 business, but prices will be low. We are inclined to think that the results of the year's business, so far as profits are concerned, will be unsatisfactory." An enterprising manufacturer in one of the central Western States expresses the following opinion: "I believe, as the tariff agitation is practically over, confidence has been restored to such an extent that we look for a marked improvement in 1895 as compared with 1893 and 1894." A leading manufacturer in heating specialties in the neighborhood of Chicago, in writing of the prospects of the coming year, says: "They are much better than a year ago. Then every one was discouraged, while now a general feeling of hopefulness prevails which, in itself, is an indication that business will be better. The low prices of building materials should serve to stimulate building, and thus lead to a larger demand for goods." A manufacturing concern located in one of the large wheat and corn growing States say that there is not much ahead to encourage them, "as the drought stricken districts will not be in a position to do much business in 1895, and this, we feel, will cut quite a figure in the volume of trade."

A concern located in one of the leading cities of the South state that they expect to do a light business for at least the first six months of the year, but after August 1 they look for better times. Another firm located in one of the States bordering the Mississippi River write as follows:

"The prospects for the coming year are not encouraging, so far as this section is concerned. The low price of cotton has hurt trade and delayed collections, and as the acreage of cotton has increased to such an extent we see no prospects for the price of cotton being much higher next year. There is some talk among Southern farmers of turning their attention to other crops and decreasing the acreage of cotton, with a view to raising the price. We believe this is the best solution of the difficulty —raising less cotton and buying less corn and pork from the West."

An Ohio manufacturer, who considers the prospects for the new year as fair, states that the open winter has kept dealers from buying, and as soon as trade brightens he believes there will be a fair volume of business in the stove line. Another concern in an adjoining State do not look for a very prosperous year, owing to the low prices of cotton and wheat, through which the purchasing power of the farmer is much reduced, and in addition to that retailers are said to be carrying large stocks of heating stoves. The opinion of manufacturers in the Northwest seems to be of about the same nature as some of the manufacturers of the South. A leading concern, writing with regard to the prospects for the coming year, say:

"We do not look for any great improvement. The farmers of the Northwest cannot raise crops with a profit. We are almost wholly dependent on the products of the soil yielding a good return, and until they do we cannot look

for an appreciable gain in the volume of trade."

The conditions which have prevailed in manufacturing circles during the past year have of course exerted a greater or lesser influence upon the working classes, to whom the trade looks for the consumption of its product. The financial strength of the purchasing classes in the Western stove trade is reported by some to be less than it was a year ago. One explanation of this is given by a leading stove manufacturing concern in the Northwest, who say:

"The farmers cannot raise wheat at 40 cents a bushel and get back the first cost. Wheat has heretofore been the staple product of the Northwest, and when farmers could get from 75 cents to $1 a bushel at the railroad stations they could make money. They must now turn their attention to more diversified farming, and it will take a little time for matters to adjust themselves. Meanwhile they will, of necessity, be compelled to restrict their purchases to the essentials."

A Pennsylvania manufacturer, referring to the financial strength of his customers, does not consider that it is more than one-half of what it was in the year 1892. This may be an extreme view, and in contrast to it is the report of a manufacturer in Indiana, who writes that, notwithstanding the hard times and the unusually low price of products, "more people have discounted their bills than ever known before." Still another writes that a closer examination of credits has had the effect of driving the "little fellows" out of business. They state that they lost less last year, in proportion to the business done, than in any previous year. Other manufacturers consider that there has been no change in the financial strength of their customers, while still others state that collections have been better than expected, customers having paid their bills promptly, while the tendency seems to have been to get nearer a cash basis.

Miscellaneous.

The conditions which have existed during the past year have had a tendency to stimulate to some extent the trade in stove repairs, for when, under ordinary circumstances, a new stove would be purchased to replace one nearly worn out, the consumer has bought repairs and made the old range or heater serve for another winter.

While, therefore, it may be stated that competition has been sharp and profits small, the volume of business transacted by the concerns engaged in the repair trade has been of a satisfactory character, and there is an encouraging outlook for the new year. Manufacturers of fire brick report a trifle less satisfactory trade last year than the 12 months preceding, and while some consider the outlook unfavorable, others regard it as good.

The unsatisfactory business in the stove trade was reflected in that of stove ornaments and trimmings, where competition was very sharp and profits smaller than the year before. The outlook, however, is regarded as much brighter than it was a year ago, and, while no "boom" is expected, a good trade is counted upon during the next 12 months.

Some of the pattern makers report the demand for patterns for castings about equal to some of the previous years, with somewhat less competition and a smaller margin of profit. The outlook for 1895 is considered good.

The Vapor Stove Trade in 1894.

To ascertain the general condition of the gasoline stove trade for the year 1894, a correspondent of *The Metal Worker* interviewed Charles A. Stockstrom, president of the Ringen Stove Company and Quick Meal Stove Company, St. Louis, Mo., with the following result:

How does the output of 1894 compare with 1893?

The total output of vapor stoves for 1894 is calculated to be about 20 per cent. below that of 1893, which would seem to compare favorably with the average decrease in the output of manufactured merchandise during that period. It should be remembered that the full force of the general depression was not felt by the retail trade to any extent until about July 1, 1893, when the jobbing business was virtually over. Of course what little might have been done during the balance of the season was absolutely cut off, but that did not materially influence the manufacturers' trade, though it had the effect of leaving a stock on the hands of those dealers who had bought liberally, and so found quite a number of them with stocks to be carried over to the season of 1894, thereby helping further to reduce the output during that year. The decline in the number of stoves sold was probably not more than 20 per cent., but in dollars and cents it was very nearly 30 per cent., for the reason that there was quite a material difference in the percentage of the kinds of stoves sold during that period, inasmuch as the junior or small and cheapest kind gained in percentage, while the evaporating stove or higher priced goods lost in proportion—all as a natural consequence of hard times. Dealers have bought very sparingly during 1894, and as a consequence light stocks are reported as a rule, except in sections of the country where bad crops did not enable them to even dispose of the goods sparingly bought.

Do you consider the evaporating stove a fixture on the market, or will it be supplanted by the generator stove?

There is no doubt now that the evaporating stove has come to stay. It has now been on the market for five seasons, and while somewhat crude at first, like all new things, has been so improved that at this present stage it might well be considered perfect. It has entirely superseded the generator stove, of which kind probably not over 1000 have been sold during the past year. Even in the junior stoves the generator principle has been discarded and hardly any of them are made except with individual burners. Dealers in gasoline stoves in late years, and more so during the last year, have become extremely conservative as far as changing their lines of gasoline stoves is concerned. Perhaps there is not an article made in the construction of which the manufacturer is so liable to err as in gasoline stoves. The most insignificant appearing little thing often makes a stove, which is otherwise correctly constructed, a failure, and the worst of it is that these defects only develop with time, some in a week or month, others in a year or still longer. Only extremely careful, long continued tests, and more especially long years of experience and a thorough knowledge of every part and its action, are absolutely necessary to successfully avoid mistakes. In former years a good many dealers would think nothing of changing their line annually for three or five seasons in succession, but now so many of them have had to pay dearly for their experience that they are not so anxious to take hold of stoves with new experimental features; in fact, they rely, as they should, to a great extent upon the good, careful judgment of the manufacturers whose goods have been handled successfully before. Such is certainly for the better interests of both dealers and manufacturers.

Has the dealer studied the construction of gasoline stoves, or does he sell them without knowing practically anything regarding their construction, &c.?

The dealer recognizes that to be successful it is absolutely necessary to be fully conversant with the detail construction of the stove, so as to be able to remedy any little trouble which may arise when the stove is in use. Failure to operate satisfactorily in gasoline stoves is generally caused by some little thing which is very easily adjusted when the construction of the various parts and the principle upon which these parts operate is thoroughly understood. Some dealers, it is true, do not want to take the trouble to learn anything about the gasoline stove. As a consequence, of course, they have lots of trouble, become disgusted with gasoline stoves in general, and finally quit the line entirely, blaming the manufacturers and their customers for all their trouble, when the blame lies entirely with them.

How do the prices of 1894 compare with previous years?

There has been virtually no change in 1894 in the price of vapor stoves to the trade, with the exception of a decline in the second grade juniors. Material was cheaper than in the previous year, though wages, which constitute more than 50 per cent. of the stove's value, have remained about the same. The stoves throughout, however, are a great deal better than they were in 1893.

Is the production of gasoline stoves much in excess of the demand?

Competition has been extremely keen, since the demand for stoves has not kept pace with the ever growing capacity of manufacturers to turn out goods, so that to-day the manufacturing capacity certainly exceeds the demand by from 50 to 75 per cent. As a consequence, manufacturers are exerting themselves to offer the best on the market.

Are the evaporating stoves turned out to-day as well made as in previous years?

Materials which go to make up the

stove have during the last year been used in heavier gauges, and of better quality than before. When useful, metals of higher grade have been substituted for iron and tin, the greatest care has been used in making all working parts perfect, and as far as outside appearance is concerned there is hardly a stove that has not been greatly beautified. To judge from present indications this policy on the part of every manufacturer, to make his line absolutely perfect and the best on the market, and so retain his hold upon the trade, will, it seems, be adhered to for the coming season. The cost of these various improvements to the manufacturers has been greatly counterbalanced by the decline in the material, but the stoves have been so much improved in safety, durability and freedom from defects, and liability to become temporarily useless, that as an article of merit before the public the evaporating stove never occupied a higher position.

What position do the Junior stoves with individual burners hold in comparison with the evaporator stoves?

Junior individual burner stoves have hardly kept pace with the evaporator. It is true the peculiar line Junior has been made much better and much safer, but on the other hand a second grade Junior has sprung up, in which, on account of the extremely low price at which it is being offered, it is impossible to embody the desirable features which make a first-class Junior as perfect in their way as the full-sized stoves. The user must necessarily be disappointed, and therefore this class of stoves, while generally considered doing missionary work toward the introduction of the evaporating stove, must rather be considered hurtful to the gasoline stove interests in general.

Vapor Stove Consolidation

A history of the year would not be complete without some reference to the efforts made last summer to consolidate the vapor and gas stove interests of the country under the management of the United Vapor & Gas Stove Company. This concern were incorporated under the laws of the State of Illinois, early in June of last year, with a capital stock of $8,500,000. The negotiations, which were in the hands of Emerson McMillin & Co. of New York, continued for a long time, and had to do with the leading manufacturers of gas and vapor stoves in Cleveland, Chicago and St. Louis. The movement made progress, and there were strong indications at one time that the object sought would be attained. Difficulties arose, however, which were not easily overcome, and the matter drifted along for many months until interest in the movement finally ceased.

The Lehigh Stove & Mfg. Company of Lehighton, Pa., have issued for the new year a very neat card calendar. The uppor portion is embellished with a landscape, in water colors, by Noakes. This is surrounded with ornamental typographical features printed in old gold and red. Attached to the lower portion of the card are the leaflets, carrying a monthly and yearly calendar.

Gas Stoves and Appliances

An increased business in gas stoves and appliances has been reported for the past year, but owing to a number of peculiar conditions the trade has been by no means satisfactory. Gas as a fuel has made a very favorable impression upon the people, and manufacturers made preparations for doing a large trade. Some of the goods were in the hands of the dealers before the full effect of the depression throughout the country was generally understood. Some eagerness was displayed later to get rid of the large stocks which had been manufactured, and as a result new fields were sought and the competition in selling reduced the profits far below a satisfactory figure. Another feature in the retail competition is the sale of these goods by gas companies, who in the desire to increase the consumption of gas either send out the stoves at a small rental or sell them on the installment plan, or at practically cost for cash, much to the disadvantage of the dealer. Some rash claims have been made by enthusiastic dealers in gas goods, and as a result too much has been expected in some quarters from gas stoves. While gas is generally reported as economical for cooking, it may safely be said that the public is not altogether satisfied with the economy of gas for heating.

Some very handsome goods have been placed on the market in both cooking and heating apparatus, the burners being invariably of the atmospheric type. In the construction of burners the object sought is to prevent firing back rather than to secure a perfect combustion or economy. It is claimed in some quarters, and particularly in reference to the cheaper and simpler goods, that there has been wholesale piracy. The effect of this was felt at the hight of the season in the low prices quoted on hot plates. Some of the demoralization in prices has been due to the handling of these goods by department stores, where price rather than quality is made the attraction.

New Goods.

During the year hot air furnaces to use gas as a fuel have made their appearance, and a few have been installed for testing this winter. A specially constructed hot water apparatus for the heating of houses has also been placed on the market. Both of these are intended for the use of artificial gas. Some new devices have been produced for attaching to the water service pipes of a building, for supplying hot water for both domestic and bathing purposes, and some others are reported as being ready for introduction as soon as the condition of the market will warrant it. There is a marked increase in the use of gas in hotel and restaurant kitchens. In this field, it is claimed, the demand is for reliable goods, and there is not so much difficulty experienced in securing fair prices for good appliances.

The Proposed Stove Reclassification.

Representatives of the Western railroad companies met in Chicago week before last to consider the reclassification of stoves. The meeting had been specially called for that purpose, in view of the numerous protests which had poured into the offices of almost every railroad company. It was decided to permit the old classification to stand until the next regular meeting of the Western Classification Committee, which will be held in July, 1895. This is an important victory for the stove manufacturers of the Central West, who recognized the movement to advance stove freights by classifying them at a higher rate as a serious menace to their trade. Just at this time any advance in cost is not willingly borne by either dealers or consumers, and the change proposed would have formed a very considerable additional item of expense to them. The manufacturers are to be congratulated on the persistent contest which they inaugurated as soon as the new classification was promulgated, and which did not cease until the railroad companies had announced their change of heart. Without detracting from the good work done by others, credit seems to be specially due to Messrs. Wm. H. Sard, Frederic W. Gardner and William H. Cribben, all of Chicago, who were unceasingly at work and ingeniously effective in bringing to bear the most persuasive influences.

ODD PLATES.

The Matthews Northrup Company of Buffalo, N. Y., are continuing for 1895 their Vest Pocket Daily Reminder, which has proved itself such an invaluable companion for business men. Their orders last year were much in excess of those of any previous year. They are bringing out 13 styles for 1895.

The Brand Stove Company of Milwaukee, Wis., favor us with one of their calendars for 1895. It is a very pretty wall calendar, composed of a heavy white card, across the top of which is printed a pleasing picture, while below are attached leaves for the months.

Rathbone, Sard & Co. now have on their sample floor at Randolph street and Wabash avenue, Chicago, a full line of their steel Acorn ranges. Hitherto they have been unable to keep up with the demand so as to properly show samples. They have six sizes in this line, with all varieties of pipe shelves and high closets, bracket reservoirs, water fronts, wood fixtures, &c. In the construction of these ranges they have aimed to furnish a steel range at moderate price, so as to sell by the side of first class cast ranges. They further adopted regular sizes of ovens—18, 20 and 22 inches—suited to regular sized baking tins, roasting pans, &c. Other important and valuable features are found in these ranges. The bracket reservoirs can be attached to any sized range in a few minutes, so that a dealer is not compelled to carry a large stock of reservoir. They are further heated by pipe connections, so that the reservoir can be used with the water front, to furnish large quantities of hot water. All have duplex grates. Fire chamber fixtures are interchangeable among all sizes. When arranged for wood the fire chamber has a swing door to take in large pieces, while the coal ranges have a chute door. These ranges are exceed-

UNIVERSITY OF ILLINOIS LIBRARY

ingly showy, having nickel pilasters on the front corners, nickel trade-mark panel on the oven door, massive towel racks, nickel uprights to high shelves, and nickel frames to all doors.

Bergstrom Bros. & Co. of Neenah, Wis., have issued a remarkably fine calendar. The leaves for the months are large, permitting the use of large figures, easily read at a distance, and printed in two shades of green. The leaves are fastened to a larger card bearing the firm's name in gilt and crimson lettering, together with their trade-mark.

A dainty little calendar, notable for its delicate coloring, is being distributed by the Magee Furnace Company of Boston. The pretty youngster whose portrait decorates the card suggests sunshine and summer weather and smiles of welcome to all who interest themselves in the Magee furnaces and ranges. An attractive feature of the calendar is the unobtrusive style in which the advertisement of the company appears.

The Portland Stove Foundry Company, Portland, Maine, are distributing with the compliments of the season an exceedingly neat folder of a size convenient to carry in the vest pocket. The cover is embellished with a colored picture showing three little children, while down in one corner are the figures 1895. The inside pages of the folder are taken up with a calendar printed in old gold upon a white ground. Below the calendar is brief reference to the Atlantic stoves made by the company.

A very neat calendar for the new year reaches us within the compliments of the Presbrey Stove Lining Company, 212 Somerset street, Taunton, Mass. The upper portion of the card is taken up with a representation of a young body driving a "Jersey Family" to the brook to drink. On the opposite side of the brook in a crouching attitude is a dog, who has every appearance of being in a great fear of his Jersey neighbors. Below the picture is the name and address of the company and further down on the card is a calendar proper. The sheets forming this differ from the general run of calendars in that they have at the right a number of blank spaces for the purposes of memoranda. The card is neatly gotten up and is arranged with a white cord for the purpose of hanging it upon the wall.

The Richardson & Boynton Company have closed their works in Brooklyn for the usual stock taking and inventory incident to the end of the year.

Rathbone, Sard & Co. of Chicago and Aurora, Ill.; Albany, N. Y., and Detroit, Mich., will make this year the Magnet Acorn range for hard coal with a fire box at the right hand, to meet the frequent calls for a construction of this character. The range will also be made of the usual pattern, with the fire box at the left hand. The Acorn pocket calendars for 1895 are being distributed. They are of the same shape and design, with revolving leaflets, as in previous years, and the demand for them, instead of falling off, constantly increases.

One of the handsomest novelties of the season to reach us thus far is that presented with the compliments of the Highland Foundry Company of Boston, Mass. It consists of two pieces of cardboard arranged in the shape of a folder, the front of the cover being embellished with a beautiful winter scene printed in colors and having all the effects of snow and ice. The picture has a frame of rustic design and depending from the twigs and leaves are long icicles and bunches of snow. Opening the folder there is revealed a winter scene that is difficult to describe. In the foreground are boys and girls amusing themselves sliding and skating, while beyond are two people in a sleigh drawn by a spirited horse, the whole presenting a very lifelike appearance. Still further in the background and at the left is a Swiss cottage, burdened with snow and ice. On the hill at the right are other buildings, the deep background showing a winding valley with the mountains covered with snow and ice, the color effects being such as to produce a charming picture. The entire make-up is such as to render the New Year's souvenir entirely unique in its way and entitle it to a prominent place in the home, for it is too handsome and artistic to be left about the office or shop. Accompanying the above is a cardboard likeness of a young maiden attired in white dress, red hat and shawl, and carrying in her hand a fan, upon which is the inscription "Highland Foundry Company, Boston, Mass." Attached to the base upon which she stands are 12 lesflets carrying a calendar for the days of the week and month, together with the phases of the moon. This unique little calendar is so made as to be used as an easel on the desk.

The Buck's Stove & Range Company of St. Louis, Mo., are distributing, with their compliments, a pocket memorandum book bound in leatherette and carrying upon the inside pages of the cover yearly calendars for 1895–96. There are several pages ruled for addresses, following which are census figures covering the principal cities of the United States and of the world, together with rates of domestic postage. Each page is divided into seven spaces, there being one for each day of the week. At the outer edge of the page is printed the day of the week and month and also the number of the day in the year. At the close are numerous pages for cash items. In the center of the little book, which is a calendar, diary and memorandum combined, we find some remarks relative to Buck's stoves, ranges and heaters.

The Anshutz-Bradberry Company, proprietors of the Tremont Stove Works, Allegheny, Pa., are sending out a very neat calendar for the new year. The upper portion of the card is printed in a delicate shade of blue, giving a bird's-eye view of the works of Henry Anshutz as they appeared in 1844 and of the present establishment. There is also a *fac simile* of the company's trademark and their long distance telephone number. There are 12 leaves for the months, while a thirteenth sheet carries a yearly calendar.

The stove mounters of Albany have been recently organized into a union affiliated with the Stove Mounters' International Union. It is said that nearly all the stove mounters in the city were enrolled.

Moore Brothers, stove founders, who occupied, a short time ago, the old Stewart Brothers' plant in Wichita, Kan., have already found their quarters too small to properly handle the business which they have built up, and they have decided to abandon their present quarters and erect a new plant. On December 22 they closed a five-years' lease for a plot at the corner of First street and Fifth avenue, which gives them about 150 feet frontage on the Atchison, Topeka & Santa Fé Railroad, with a depth of 225 feet. The firm will at once commence the erection of buildings of suitable size to accommodate their business.

Hess, Snyder & Co. of Massillon, Ohio, favor us with a copy of the 1895 calendar which they are distributing to their friends in the trade. Accompanying the calendar is a letter stating that the company will consider it a special favor if it is hung in a conspicuous place where it will serve as a standing reminder of the goods which they manufacture. The calendar is in the form of a large poster, bound with metal strips and embellished with a representation of a painting by Despartes entitled "Royal Setters. Time of Louis XIV of France." Beneath the picture is the name and address of the company with an indication of the lines of goods manufactured. The 12 sheets constituting the calendar proper are printed in clear black letters and figures, so that they are readily recognized at a distance. The company carry a large stock of goods on hand, and are in a position to promptly handle all orders with which they may be entrusted.

The Eclipse Stove Company of Rockford, Ill., notice of the incorporation of which appeared in a recent edition, are the outgrowth of the old Van Wie Stove Company, and will occupy what is known as the Knowlton plant.

The Keeley Stove Company of Columbia, Pa., shut down on December 20 for the purpose of taking account of stock.

The Marshall Furnace Company, Marshall, Mich., are, we understand, looking about for more commodious quarters, which will enable them to handle their growing business to better advantage. A representative of the company was in Jackson looking at several sites, but up to latest advices no decision has been reached.

We have received from the Co-operative Foundry Company, Rochester, a copy of the handsome calendar which they have issued for 1895. The groundwork consists of a card measuring 11 x 14 inches, across the top of which, in script letters, is the name and address of the company printed in old gold. A *fac-simile* of the company's trade-mark appears in the same color. The sheets carrying the calendar proper are 9 inches square, and are cut to closely resemble a Greek cross. The printing is in white, in clear cut type, upon reddish brown paper, forming a sharp contrast, and enabling the figures to be clearly seen at a distance. The leaves forming the calendar proper are mounted upon a black groundwork, the entire make-up being rich and effective.

The works of F. & L. Kahn & Bros. of Hamilton, Ohio, closed on Saturday, December 22, for two weeks, during which time the usual inventory will be taken and necessary repairs made.

The Star Coupler Company, St. Louis, Mo., who manufacture the Star coupler for connecting lead to lead pipe and lead to iron pipe, report a heavy increase in the demand for these goods. Dealers who ordered sample lots are now sending in orders for full stocks, and the works of this company are taxed to meet the demand. They are shipping large quantities to stove dealers for connecting water backs to boilers.

LAST WEEK the traveling salesmen of the Favorite Stove & Range Company of Piqua, Ohio, rendezvoused at the Plaza for the holidays. According to a local paper they commenced arriving Christmas night and the last of them put in an appearance Wednesday noon. The list included Tom Clemons of Cincinnati, Ohio; W. P. Sanders of St. Joseph, Mo.; W. H. Pier of Flint, Mich.; W. L. Miller of Chicago, Ill.; J. C. Frame of Indianapolis, Ind.; W. H. Lautzenheiser of Maumee, Ohio; J. C. Taylor of Newport, Ky.; J. E. Schroyer of Indianapolis, Ind., and C. Winkelman of Piqua. They had as their guest Daniel Holden of Bloomington, Ill., Superintendent P. G. Van Wie of the Gas Appliance Department of the company was also a member of the party. The company remained over Sunday, December 30, when they departed for the various sections of the country which they cover in the interest of the company's goods.

B. C. BAXTER, General Manager of the Monarch Stove Company, Mansfield, Ohio, left on the 28th of December for an extended trip through the West and Northwest, for the purpose of establishing distributing agencies in the principal cities of that section, including Chicago, St. Paul, Omaha, St. Joseph, Lincoln and Kansas City.

N. S. KNIGHT has recently severed his connection with the Fuller & Warren Company, Troy, N. Y., and will in the near future call upon his friends in the trade in the interests of the Howe ventilating stoves, made by the Cortland Howe Ventilating Stove Company, Cortland, N. Y.

A RECENT ADDITION to the staff of traveling salesmen of the Monarch Stove Company of Mansfield, Ohio, is H. H. Sanford, who will represent the concern named in the State of Iowa. Mr. Sanford has had many years' experience as a stove salesman, he having represented the Chicago & Erie Stove Company for the past 12 years. In the future, however, he will devote his energies exclusively to the interests of the Monarch goods in the territory named.

THE INSURANCE STOVE & OIL COMPANY have been incorporated at Cincinnati, Ohio, by Herman H. Uckotter, A. J. English, William Uckotter, George Uckotter and Charles A. Alborn, for the purpose of manufacturing and dealing in vapor stoves, together with other machines and devices, and also for the purpose of dealing in oil, with a capital stock of $10,000.

G. T. TRAIN, Memphis, Tenn., has purchased the interest of N. A. Kendall in the Memphis Stove Repair Company.

AT THE ANNUAL MEETING of the Quick Meal Stove Company, St. Louis, the following were elected its officers: President, Charles A. Stockstrom; secretary and general manager, Louis Stockstrom.

VOELKEL & SCHULTZ, Shelby, Texas, have succeeded Ernest Voelkel in the stove and hardware business.

AT THE RECENT ELECTION held by the Ringen Stove Company, St. Louis, the following officers were elected: Chas. A. Stockstrom, president; E. H. Stockstrom, secretary and treasurer. Geo. Kahle, who has been president of the Ringen Stove Company for some years, virtually retired from active business two years since, but still continued to hold the position of president. Deciding to make his home in Dresden, Germany, he has relinquished the presidency and, as above stated, Chas. A. Stockstrom has been elected in his place.

FRANK TULLY, formerly with the Boynton Furnace Company, Chicago, will change his address to 79 Lake street, where he will have charge of the heating department of Geo. L. Rood.

THE KERNAN FURNACE COMPANY will be represented in Chicago by Kernan & Sweeney, 71 West Washington street. The above firm are composed of Joseph F. Kernan and Charles A. Sweeney, who will handle the Chicago and Western trade and will carry a full line of Kernan furnaces.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

B. D. DUGGAN, 207 209 Lake street, Chicago, is to install a No. 424 Richmond steam heater in the residence of of Mrs. C. Claflins, Oak Park, Ill.

KEHM BROS. & MERTZ, 289 East Kinzie street, Chicago, have the contract for steam heating in the two four-story store and flat buildings of Gerhardt Roth, Cleveland avenue and Menominee street.

PURVIS & BROCKWAY, 215 Fifth avenue, Chicago, are to install a hot water heating plant in the residence of J. S. Brockway, Western Springs, Ill.

JACOB G. WEBBER, 244 North Clark street, Chicago, has contracts for the plumbing, gas fitting and sewerage in the following residences: G. O. Gottman, Baldwin street and Wilson avenue; J. L. Cochran, 41 Kenmore avenue; E. N. Higgins, Edgewater.

THE REQUEST made by T. Fornoff at the last meeting of the City Council of Union Hill, N. J., to be allowed to withdraw his bid for placing steam heating apparatus in the fire houses in the Town Hall was granted, and the contract was awarded to the next lowest bidders, Knack & Son.

J. F. BRADY & BRO., Bridgeport, Conn., have the contract for the plumbing in the new house of P. Burns.

THE AMERICAN DISTRICT STEAM COMPANY of Lockport, N. Y., have secured a contract for a steam heating plant at Terre Haute, Ind., for the Terre Haute Electric Light & Railway Company. They also secured a contract for a plant at St. Joseph, Mo.

H. C. SIMMONS of Bennington, Vt., has secured the contract for heating the new Methodist church.

ANTHES BROS. PLUMBING COMPANY, Fort Madison, Iowa, have the contract for covering the pipes in the First Ward and High School buildings. They are also at work on the steam heating and plumbing for the Masonic Temple, Lee County Savings Bank Building, and have completed a fine job in the Hesse Block, corner of Second and Pine streets.

J. MALLMAN & Co., 134 Center street, Chicago, are doing the plumbing, gas fitting and sewerage in the O'Neal Building, Lincoln avenue and George street.

FRANK J. RUH, 1204 Diversey street, Chicago, has contracts for the plumbing, gas fitting and sewerage in the following residences: Peter Glnd, 842 Lincoln avenue; John A. Lundahl, 1318 Wolfram street; John Krunze, Clifton and Belmont avenues.

GEO. L. ROOD, 79 Lake street, Chicago, is to place a Prince Royal combination heater in the residence of Dr. O'Neal, 113 Garfield boulevard.

AMONG THE CONTRACTS recently taken for steam heating by the Charles H. Simmons Company, 72–74 Market street, Chicago, can be mentioned the following: Office building, River and Dock streets; flat building of Mrs. Thos. Burrows, 298–306 Erie street; three houses of Nortman, Schlack & Gutrich, Boulevard place.

Decimal Sheet Metal Gauge.

The Norfolk & Western Railroad, says the *Railroad Gazette*, has taken a step in the right direction in casting aside the present confusion and annoying gauges for sheet metal, wire, tubing, &c., and has started a decimal system which prevents discussion as to what a gauge number means. Specification 10 B, issued by R. H. Soule, superintendent of motive power, is for a gauge for sheet metal, wire and tubing, and is as follows:

Sheet metal, wire and tubing (less than ¼ inch in thickness), should always be ordered by expressing the thickness in decimals of an inch, in accordance with the following table, in which the figures in heavy type are decimals of an inch and are to be used in making requisitions; the figures in lighter type show the nearest thickness according to the Birmingham gauge, these light figures being given for convenience of reference only.

Inches.	Birmingham gauge.	Inches.	Birmingham gauge.	Inches.	Birmingham gauge.	Inches.	Birmingham gauge.
.002	....	.022	24	.065	16	.125	11
.004	36	.028	22	.070	15	.135	10
.006	35	.032	21	.075	..	.150	9
.008	33	.036	20	.080	14	.165	8
.010	31	.040	19	.085	..	.180	7
.012	30	.045	....	.090	..	.200	6
.014	28	.050	18	.095	13	.220	5
.016	27	.055	17	.100	..	.240	4
.018	26	.060	...	.110	12	.250	3

These gauges are made in the usual form of a disk by the Brown & Sharpe Mfg. Company, and Mr. Soule has made arrangements so that any one wishing them can purchase them direct from that company. It is understood that they are kept in stock. The large figures in the table give the dimensions of the notches in the gauge and the small figures give the nearest Birmingham gauge number.

Six hundred Slav laborers employed at the Edgar Thomson blast furnaces, Bessemer, Pa., have refused to accept a reduction in wages and have gone out on a strike. Eight of the nine blast furnaces have been banked.

The first extensive cold wave of the season has had a severe grip on the country during the past week. The mercury fell to 32° below zero in the Adirondacks.

The Baltimore & Lehigh Railroad, which is now being extended to York, Pa., is about to substitute electricity for steam as its motive power.

TRADE REPORT.

The Iron Market.

The record of the last week in 1894 has not been been very cheerful, particularly on account of the low prices made in the Central West on Bessemer Pig and on Steel Billets. The year closed with sales of Bessemer Pig for early delivery at $9.80 @ $9.85, Pittsburgh, the lowest on record.

Steel Billets have declined to $14 80 @ $14.85, Pittsburgh, with quite an active market, consumers evidently feeling that it is safe to cover early requirements. Reports have it that Chicago has captured a 10,000-ton order in the Cleveland district.

In Eastern Pennsylvania $17, delivered, has been touched, which makes the Western price, on the basis of open freights, a little lower. Wire Rods have weakened further and now $21 at Western mill can be done.

All this means that prices are down to bed rock, and that it is hardly worth taking the chances of possible future contingencies for the sake of reaching a possibly slightly lower level.

Conspicuous among these contingencies is the danger of labor troubles. The lowering of the scales by a leading Pittsburgh concern may drive others in the same direction. It is a step which is much to be deplored.

A number of moderate Cast Pipe orders have been placed and others are getting into shape.

There is little real change in the market for Foundry Pig. The Southern railroads have announced an advance of 25¢ in freight rates to the coast and New England markets. The impression is that they really mean it this time.

The following remarks regarding the Eastern Iron trade, furnished by our Philadelphia representative, show the prevailing condition of the Iron market at the close of 1894 : The outlook continues favorable as regards the volume of business, but prices are irregular and unsettled, and with the exception of Foundry and Mill Irons, which are steady, almost everything has a downward tendency. At these low prices any material decline is out of the question, but when the margin between actual cost and actual selling prices is so extremely narrow, even fractional declines assume considerable importance. Fuller time is being made, however, than was the case earlier in the year, and it is probable that manufacturers are doing as well as at any time during the past twelve months, and very much better than they were during the latter part of 1893, so that the general result is favorable, notwithstanding the low prices. The outlook for the coming year may also be said to be fairly encouraging, but nothing decidedly aggressive is looked for until the next crop begins to develop. It is satisfactory to note that most of the iron works will start the new year with a fair amount of work in hand, also that negotiations now in progress promise well for its continuance.

Pig Iron.—The announcement of an advance of 25¢ a ton in the freights from Southern furnaces to Northern consuming points is the most important event of the week. The New York market continues very quiet. We quote $12 @ $12.50 for No. 1 ; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

Our Philadelphia representative writes: The year closes on a fairly steady market, and it looks as though prices would be relatively firm for Foundry Irons. Consumption is increasing, however, and as there is a possibility of higher cost for both Ores and Coke, prices of Pig Metal may in that case be worked a little higher, but the general impression is that 1895 will be a year of extraordinarily low prices. At the moment there is not much disposition to buy in advance of requirements, although orders could be placed at practically the lowest figures ever recorded. The movement in prices during the year shows a decline of about $1.50 on Foundry Irons, quotations on the first of each month being as follows:

JANUARY, 1894.	
No. 1 Foundry	$13.75 @ $14.25
No. 2 Foundry	13.00 @ 13.25
FEBRUARY.	
No. 1 Foundry	$13.00 @ $14.00
No. 2 Foundry	12.50 @ 13.25
MARCH.	
No. 1 Foundry	$13.00 @ $13 50
No. 2 Foundry	12.25 @ 12.75
APRIL.	
Standard No. 1 Foundry X	$12.75 @ $13.25
Standard No. 2 Foundry X	12.00 @ 12.50
No. 2 Plain	11.00 @ 11.25
MAY.	
Standard No. 1 Foundry X	$12.50 @ $12.75
Standard No. 2 Foundry X	11.75 @ 12.25
JUNE.	
Standard No. 1 Foundry X	$12.50 @ $12.75
Standard No. 2 Foundry X	11.50 @ 11.75
JULY.	
Standard No. 1 Foundry X	$12.50 @ $13.00
Standard No. 2 Foundry X	11.50 @ 12.00
AUGUST.	
Standard No. 1 Foundry X	$12.50 @ $13.00
Standard No. 2 Foundry X	11.50 @ 12 00
SEPTEMBER.	
Standard No. 1 Foundry X	$12.50 @ $13.00
Standard No. 2 Foundry X	11.50 @ 12.00
OCTOBER.	
Standard No. 1 Foundry X	$12.50 @ $12.75
Standard No. 2 Foundry X	11.50 @ 11.75
NOVEMBER.	
Standard No. 1 Foundry X	$12.50 @ $12.75
Standard No. 2 Foundry X	11.50 @ 11.75
DECEMBER.	
Standard No. 1 Foundry X	$12.50 @ $13.00
Standard No. 2 Foundry X	11.50 @ 11.75

Advices from Chicago report that during the week sales of local Coke Iron were particularly good. Several contracts were made for good lots, in some cases running as high as 750 tons. Quite a number of foundrymen ordered shipments to be made to their yards, so as to be in readiness to start up immediately after the first. Business is, therefore, in much better condition than usual at this time of the year. Several important contracts are also pending. Prices on local Coke Iron are well maintained at the advance recently made, but Southern Coke Iron is giving way, and the margin between local and Southern Irons has been considerably lessened. Contracts taken for Southern Iron during the week were made at cut prices by leading Southern companies which have heretofore claimed that they were well fixed for business and would not make low prices. Quotations are as follows, for cash:

Lake Superior Charcoal	$13.00	@	$14.00
Local Coke Foundry, No. 1.	10.25	@	10.50
Local Coke Foundry. No. 2..	9.75	@	10.00
Local Coke Foundry No. 3.	9.50	@	9.75

Foundry Iron is very quiet in the Pittsburgh market and some low prices are reported to have been made. Quotations are given as follows:

No. 1 Foundry	$11.00	@	$11.25, cash
No. 2 Foundry	10.50	@	10.65 "

Advices from Cincinnati are to the following effect: There has been scarcely a feature in the local market for Pig Iron during the past week worthy of special mention. As a rule, the orders received have been few and for small amounts, yet a few firms have been rewarded by a fair run of business. The disposition of buyers to hold off has resulted in some accumulation of stocks at furnaces in the South. At the close there is more inquiry, and one or two large buyers are in the market for round amounts, one sale of 3000 tons of Foundry Iron being noted at about inside quotations. The Pipe works continue to be the largest melters of Iron at the moment, the relatively low prices current for Pipe, permitted by the low market for Pig, inducing most of the large cities in the country to provide the means to renew and expand present water systems. In fact, there is a general anticipation of a large volume of business after the 15th inst., but with ample Iron offering no advance in prices is expected. Northern Iron is being offered more freely; especially is the Chicago output reported to be seeking a market in Indiana and elsewhere in this territory at a low level. A prominent feature of the general situation in the South among furnaces seems to be an extreme diversity of opinion respecting the present value of Iron, as well as the future course of the market, the result of the various and conflicting views being an unsettled, if not an erratic, market. Quotations are as follows :

Southern Coke, No. 1	$9.75	@	$10.00

DERWENT FOUNDRY COMPANY, Ellwood City, Pa., are erecting an enameling furnace in connection with their plant, to enamel iron articles of all kinds.

Metal Market.

Pig Tin.—Prices have receded sharply and the market remains in a weak, unsettled condition, suffering from the weight of heavy stocks here and in Europe, together with unusually large quantities afloat. It is calculated that the visible supply on January 1 was 24,614 tons, against 22,445 tons last month, and 16 390 tons a year ago. Spot stock in the United States, exclusive of Pacific Coast, is estimated at 2714 tons, and the quantity afloat at 1585 tons. European spot stocks were 13,674 tons and the afloats 6641 tons. Shipments from the Straits during December amounted to 5020 tons, of which 1120 tons to United States, 3100 tons London, and 820 tons to the Continent. Speculation here has been fairly active, with the leading operators prominent as sellers of near futures, and also offering the distant deliveries at a discount. Retail business has been tame, and prices for small lots are unchanged at last week's quotations, viz.: 15¼¢ @ 16¢ ℔ lb for Straits Pig.

Copper.—No new features have come to the surface during the past week, but a quasi air of mystery is still assumed by the leading sellers, who represent the market as being very firm, yet give no particulars of any important business. From the few facts divulged it would appear that the demand for material for electrical purposes is relatively better than that experienced for other sorts. Inquiries are being received for small quantities for immediate delivery, but orders are still very limited. Lake Ingot in small lots from store is still quoted at 10½¢ ℔ lb.

Sheet Copper.—There is little movement in the trade at the present moment. Consumers are generally engaged in stock taking and figuring out their future requirements. A few weeks will probably develop more inquiry. As the amount of building in prospect is larger than it has been for some time past, there is the likelihood that a gratifying improvement in the demand for Cornice and other manufactured Copper may be brought about in the coming months. Prices are firm for small lots of Sheet Copper from store on a net basis of 15¢ ℔ lb.

Pig Lead.—Business has been on a very moderate scale and the market has shown rather poor form, since consumers have manifested reluctance to take round lots of common Western at over 3¢. The retail demand is fair, small lots being quoted at 3⅝¢ @ 3¾¢ ℔ lb.

Lead Pipe and Sheet.—Jobbers report a very tame demand, although inquiry has been rather larger since the first of the year. No great revival in the business is looked for, however, much before early spring. Prices are weak, though the list is unchanged in this district. A reduction in rates on Lead Pipe and Sheet made by a Pittsburgh Lead company is noticed in another column.

Spelter.—Business has been moderate during the week and the demand is slow in this vicinity. The market is steady, however, deapite it narrowness. Prices rule for small parcels at the same figures quoted for several weeks past—namely, 4¢ @ 4¼¢, for Western, and the usual premium on fancy brands.

Antimony.—The market has remained quiet, with prices barely steady. Cookson's in small retail lots is quoted at 9¼¢ @ 9½¢, and Hallett'a at 8¢ ℔ lb.

Nickel.—Prices remain at about 38¢ @ 42¢, according to size of order.

Tin Plates.—Little improvement has taken place in aales of stock goods, and the buying of futures has been on a moderate scale. Jobbers report, however, that the volume of inquiries has increased to a gratifying extent within the last few days. A tendency is also seen toward an interest on the part of consumers in larger lots than they have cared to think of lately. It is hoped that many of these inquiries may materialize and that a brisker business in Tin Plates will develop within the next week or two, when purchasers have figured out their requirements for the month. Stocks are fairly heavy, but the assortment is still rather poor, especially in odd sizes. Prices have not varied much, but are rather weak.

A London cable dispatch of January 2 to *The Iron Age* reports on the British Tin Plate market as follows: In the Tin Plate market business has been slow, although more inquiry was made toward the close of the week. Prices have not changed materially. Shipments have been heavy, but stocks still amount to 225,000 boxes. The quotations, f.o.b. Swansea, are as follows:

Bessemer Cokes, IC 14 x 20	@ 9/6
Siemens Cokes, IC 14 x 20	9/9 @ 10/
J. B. Steel Cokes, IC 14 x 20	
Ternes, 20 x 28	18/6 @ 21/
Charcoals, IC 14 x 20	10/6 @ 12/6

Sheet Iron.—Mills are fairly well supplied with orders for deliveriea extending into the next three months, and inquiry in this class of business is active. Spot and jobbing business in Black Sheets is light. Galvanized Sheets are in moderate demand. Prices show no change.

Chicago Report.

Scrap. — Only small trades are in progress at this time. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per ℔
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.50	....
Stove Plate (free of burnt)	4.25	....
Burnt Iron and Grate Bars	3 00	....

CONDITION OF THE

Hardware Trade.

TRADE DURING the past year was somewhat disappointing to those who had formed expectations of a speedy recovery from the financial and mercantile depression of 1893, but on the whole it may be reviewed with a feeling of some satisfaction, in view of the increased volume of business over the preceding year and the manner in which the trade endured the continued depression. The volume of businesa was unquestionably fair, as compared with other years, so far as the quantity of goods is concerned, while the decline in values kept down the amount as expressed in dollars and cents. The trade was, however, somewhat spasmodic, periods of something like the old-time activity being followed by intervals when the demand fell off largely and the tone of the market became unsettled and weak.

It is not expected that the last week in December will be characterized by a great volume of business. The fact that travelers are home, that attention is given principally to closing the books and preparing for the new year, and that the holidays with their festivities and amenities engross to a good extent the energies of employers and employees, are influences the full force of which has been felt during the week under review. In other columns we discuss at some length the course of things during the past 12 months and touch upon the outlook for 1895. We trust that our readers have reason for a good degree of satisfaction in the retrospect and in the results of the past year, and to one and all we express the hope that the year which has opened will bring them a large measure of happiness and prosperity.

Advices from Chicago.—The Shelf Hardware trade is in a little better condition than usual at the close of the year. Traveling men are almost without exception at home, and consequently the orders received are those which are being sent in voluntarily by the country trade. Monday mails were not expected to be heavy, but exceeded expectations. In the course of the coming week the salesmen will again be on the road, and the prospects are excellent for immediate business. Prices have been revised for the coming year very extensively, Changes were made in prices from time to time during the year, but not so comprehensively as will now be done. In very few instances will there be an advance, but the reductions made are in some cases small and in others somewhat radical, to meet the new conditions now prevailing.

Notes on Prices.

The important reductions in price during the year have been chiefly in staple goods, but general and Shelf Hardware has to a great extent sympathized with the downward tendency, and the changes which have taken place are illustrated in those referred

to below, where we touch upon only a few of the many lines which enter into a Hardware stock.

Wrought Iron Pipe.—There has been considerable shrinkage in the prices of Pipe, and manufacturers are complaining of the unprofitableness of their products. There has been some conference with a view to determining what can be done to better the situation, and there is some talk of a new list.

Rope.—The market during the past year has been a vacillating one, and while there is not a marked difference in the prices prevailing now and those which prevailed last January there have been a number of changes during the year.

Steel Goods and Wood Goods.—In Steel Goods the decline in price has not been very great, but it is worth noting, and competition is active. Wood Goods, on the other hand, have, as the phrase is, gone to pieces, and lower prices rule.

Screws.—This is one of the lines in which an important reduction has taken place, the base discount being at the end of December 85 per cent., instead of 70 per cent. on the first of January last. At one time an effort was made to secure concerted action among the manufacturers, but without success.

Tacks.—It is worthy of mention that Tacks are somewhat higher than a year ago, owing to the good understanding between the principal manufacturers. Outside competitors are, however, making semewhat lower prices, but notwithstanding the fact that they are well occupied with orders they do not appear to be producing much impression on the general tone of the market.

Wire.—The low price current for Wire and Wire products is one of the features of the market, and there are as yet few signs of an improvement.

Bright Wire Goods.—Competition between the manufacturers has been strenuous, and low quotations have been current nearly all the year.

Wrought Goods.—A similar remark may be made in regard to Wrought Goods, which show a large decline in price during the 12 months under review.

Nails.—During the past year, while the sale of Nails was probably larger than for the preceding year, the decline in price which began in 1893 continued and low quotations prevailed, the market closing at as low figures as had been made at any time during the year.

Wire Nails.—The last week of the year developed nothing of special importance in the Wire Nail market. The volume of business shows, however, a marked falling off, which is attributed principally to the fact that at this season comparatively little attention is given to the placing of orders. It is noted, however, that there is a good deal of inquiry, and manufacturers regard the prospect for a large demand during the next month or two as excellent. Prices are without quotable change, but there is possibly a slightly less firm tone to the market. Small lots from store in New York are held at $1.15 to $1.20. An important transaction is announced, inasmuch as the Bigelow & Dowse Company of Boston have purchased the entire stock of Wire Nails at the Carnegie mills in Beaver Falls. We understand that this purchase, which covers a complete assortment, is in the vicinity of 40,000 kegs.

Advices from Chicago.—The local manufacturers are sold well ahead, but outside concerns have pursued a more conservative policy, and have great faith that they will be rewarded for their action by much better business, at better prices, when the usual large volume of trade comes up in January and February. Jobbers quote small lots from stock at $1.10, and for direct shipment from factory at $1.05, with mixed carloads at $1.

Cut Nails.—The Cut Nail Market is inactive and prices unchanged. Small lots from store, in New York, at 90 to 95 cents.

Advices from Chicago.—Manufacturers' orders connue to be a little heavier than usual. The shipments made last week were exceedingly good, causing the representatives of this branch of trade to feel in very much better humor over present business and coming prospects. Prices are unchanged at $1 for small lots from stock.

Barb Wire.—The Barb Wire market is sluggish, but prices have not receded further. The tone of the market, however, is not strong. Manufacturers continue to take a hopeful view of the outlook for next year, and expect to market a very large quantity of Wire.

Advices from Chicago.—Business generally has been light since last report, but the few salesmen who are still out continue to pick up orders of more or less consequenee from day to day. A much better trade is expected in January. Quotations are now $2 and $1.65 for small lots for direct shipment from factory, and $2.10 and $1.75 for small lots shipped from stock.

White Lead.—Practically the same conditions exist that have prevailed for several weeks. Buyers of round lots of dry Lead place orders indifferently, since present indications point to ample supplies in the near future, while the surroundings are bare of anything that would cause apprehension of higher prices. Orders for Lead in Oil are of unimportant volume at the moment, most jobbers having their near future wants well provided for, while the smaller trade are slow about putting in supplies for the spring season. There is still more or less irregularity in prices, but no positive changes have taken place recently in either American or foreign brands.

Red Lead.—A moderate business only has been effected of late and buyers manifest indifferent interest. The larger consumers have their probable near future wants well provided for and manufacturers and importers offer somewhat reservedly in consequence. Prices for both domestic and foreign makes remain unchanged.

F. E. Myers & Bro.—The extensive line of Force, Lift, Windmill, Tank, Spray and Cylinder Pumps manufactured by F. E. Myers & Bro., Ashland, Ohio, and listed in their catalogue, is subject to a discount of 55 per cent. to the trade, 60 days. The firm are offering net prices on Myers' Hay Carriers, Forks, &c., which will be furnished on application.

Lead Pipe and Sheet Lead.—Bailey-Farrell Mfg. Company, Pittsburgh, Pa., informs us, under date of January 1, that their prices for Lead Pipe in whole coils is 4½¢ and Sheet Lead, 5¢ per lb., subject in both cases to the usual discount of 20 %.

Shot.—Under date of January 1, 1895, a reduction in the price of Shot is announced, the market being now represented by the following quotations:

Drop Shot, sizes smaller than B, per 25-pound bag	$1.10
Drop shot, sizes smaller than B, per 5-pound bag	.30
Drop Shot, B and larger sizes, per 25-pound bag	1.35
Drop Shot, B and larger sizes, per 5-pound bag	.35
Buck and Chilled Shot, per 25-pound bag	1.35
Buck and Chilled Shot, per 5-pound bag	.35
Dust Shot, per 25-pound bag	1.75
" " " 5 " "	.40

Terms, net cash, 30 days, or 2 per cent. discount for cash within 10 days of invoice date. In lots of 2000 pounds and upward, taken at one time, a discount of 20 cents per 100 pounds and 2½ per cent. will be allowed.

Glass.—The beginning of the new year brings no perceptible change in the condition of the Glass trade. There is very little demand either from factories or from jobbers for Glass, though it is reported that factories will be busy for four to six weeks to come in filling orders already taken. The impression generally prevails that spring will show an improvement in trade. The question whether prices will advance with the year is problematical, and different opinions are expressed on the subject by those connected with the Glass trade. To some indications point to higher prices before next fall, while others believe that prices will largely be under the control of jobbers, owing to the large quantities of Glass bought by them at prices lower than 90 per cent. discount. Owing to the demoralization of prices and the lack of demand, no reliable quotations are available at the present time. As an indication of recent prices, however, it may be stated that during the latter part of December, 1894, a Cleveland jobbing house quoted Pittsburgh Window Glass as follows: Single strength, 85 and 20 per cent. discount; double strength, 85 and 20 and 5 per cent. discount. A comparison of prices during the past year shows that Pittsburgh Glass in car lots at factory opened January 4, 1895, at 85 and 5 and 5 per cent. discount for single, and 85 and 10 and 5 per cent. discount for double strength. In June the price quoted was 80 and 10 and 5 for single, and 80 and 20 per cent. discount for double strength Glass. In December the market was represented by a quotation of 90 to 90 and 10 per cent. for both single and double strength Glass.

Old Metals.—The market is quiet and prices unchanged. The following quotations represent the current rates paid by dealers in the city:

Heavy Copper	₩ lb 7 ¢
Light and Tinned Copper	₩ lb 6½¢
Heavy Brass	₩ lb 4¾¢
Light Brass	₩ lb 3¾¢
Lead	₩ lb 2¾¢
Tea Lead	₩ lb 2½¢
Zinc	₩ lb 2⅛¢
No. 1 Pewter	₩ lb 10 ¢
No. 2 Pewter	₩ lb 5½¢
Wrought Scrap Iron. ₩ gross ton	$7.50 @ $8.00
Heavy Cast Scrap. ₩ gross ton	7.50 @ 8.50
Stove Plate Scrap. ₩ gross ton	5.00
Burnt Iron. ₩ gross ton	3.00

Old Rags, Paper, &c.—Demand is fair and prices substantially the same as those quoted last week. New York dealers' purchasing rates are as follows:

No. 1 White Rags	℔	3	@ 3¼¢
No. 2 White Rags	℔	2¼	@ 2½¢
Mixed Rags	℔	¾	@ 1 ¢

Old Rubber.—The following quotations represent about the prices paid by dealers, New York delivery:

Car Springs, ton lots, ℔	$0.03¾ @ .04
Rubber Shoes, carloads, delivered at factory, ℔	@ .05¼
Rubber shoes, less than carloads, ℔	@ .04¾
White Wringer Rolls, ℔	@ .03⅞
White Syringes, ℔	@ .03⅞

Recent Revisions in Brass Lists.

IN PRICE-LIST No. 4 of the American Brass Manufacturers, recently issued, a number of minor changes have been made and new matter added, as follows:

Roll and Sheet Brass.

On page 3 has been inserted, "Add for polishing on one side 40 cents per square foot; on both sides, double this price. Segments, Pattern Sheets and Circles cut from above metal of proportionate width, No. 10 and thinner, 6 cents per pound additional. Segments, Pattern Sheets and Circles cut from above metal of proportionate width, thicker than No. 10, 10 cents per pound additional. Patent Leveled Engravers' Sign Brass, not more than 30 per cent. discount on above list."

Slitting Metal.

On page 4 this explanation or definition has been parenthetically inserted: "Drawn strips are all metal drawn in dies, thinner than No. 8 Brown & Sharpe gauge; No. 8 Brown & Sharpe gauge and thicker, listed and sold as rectangular rod."

Sawed Metal.

On the same page is new matter, as follows: "All metal heavier than No. 6 Brown & Sharpe gauge, listed and charged as sawed metal, whether slit or sawed."

Printers' 2 x 4 Sheets and Galley Sheets.

On page 5 a reduction has been made on High Brass Screen Plates from net 15 cents per pound to net 13½ cents per pound.

German Silver.

On page 7 where formerly the price for slitting German Silver was double that for slitting Brass, a decrease has been made, the charge now being uniform for either metal at the rate heretofore charged for slitting Brass.

Brazed Brass Tubing.

On page 9 the following provisions are now regularly a part of the list, where before they were special and variously interpreted by individual concerns: "3-inch, per pound, 40 cents; over 3 inch to 3½-inch inclusive, 45 cents per pound; over 3½-inch, 50 cents per pound."

At the bottom of the page in the same classification has been added, "Combination Tubing, 60 cents per pound. For price on rectangular brazed Tubing, take diameter from shortest side and charge accordingly."

Brass Moldings.

On page 10 will be found new matter as follows: "Angle and Channel Brass to be listed and sold as Half-Round Molding." Immediately following this, the text has been entirely remodeled, and is now as follows:

High Brass Door Rail, 1 inch and wider, No. 18 Brown & Sharpe gauge and heavier, polished or unpolished, 36 cents per pound.
Less than 1 inch in width, 40 cents per pound.
Lighter than No. 19 Brown & Sharpe gauge, advance of 2 cents per pound for each number.

It will be noticed that the list given above as 36 cents was formerly 35 cents.

Trade Notes.

THE COOLEY SAD IRON COMPANY of Kansas City, Mo., have been incorporated, with a capital of $9000, fully paid in. Herbert M. Cooley, William G. Hawes, Darwin Wentworth, Willard C. Parker, and Clarence S. Palmer are the incorporators.

THE GEORGIAN BAY MICA, MINING & MFG. COMPANY of Salamanca, Cattaraugus County, New York, have been incorporated at Albany, to mine and market minerals, including Mica, Copper, &c. The company's capital is given as $60,000, and the directors named are John J. Inman, Nicholas L. Kysor of Salamanca, and Henry Harris of Parry Sound, Ont., Can.

THE NILES STAMPING COMPANY have been incorporated at Niles, O., with a capital of $5000, by L. G. Hutchison, F. C. Robbins, J. F. Morris, Geo. B. Robbins and C. W. Perkins, for the purpose of buying and selling sheet metal and sheet metal products and to manufacture sheet metal merchandise.

The free class in architectural and mechanical drawing, at the Senior Evening School, 58 Fifty-second street, near Eighth avenue, New York City, was resumed on Thursday, January 3, 1895. Students of architecture, machinists, masons, carpenters and those working in handicrafts generally who wish to avail themselves of the opportunity offered by these free classes are invited to apply on any school evening after 7 o'clock.

A Chicago company are said to be desirous of furnishing illuminating gas in New York City at a charge of 90 cents and fuel gas at 75 cents per 1000 feet. Senator Sullivan is to introduce a bill in the New York Legislature to grant the company a charter.

The Belgian briquette industry is all that is making remarkable progress. Exports for the ten months of this year ending with October reached a total of nearly 500,000 tons, or double the amount exported in the corresponding period of 1892.

GOODWIN'S

Improved Book-keeping

AND

Business Manual

By J. H. GOODWIN.

Sixteenth edition; Forty-first Thousand; Four Thousand Testimonials; Richly bound in cloth, price, $3.00

"I find that your book contains many important points never brought out before in a work of its kind. I consider it invaluable to the fraternity of bookkeepers in general, and in particular to those who are connected with the offices of large mercantile houses."—W. H. RUSSELL, head bookkeeper for The H. B. Claflin Company, importers and jobbers of dry goods, New York City.

"Am following your directions and have lessened my labor *one-half*. I admire your system in every respect."—JAMES H. LOVELESS, bookkeeper for C. C. McCarthy, wholesale boots and shoes, Columbus, Ohio.

"Your book *far surpasses* my expectations, containing, as it does, so much valuable information."—CHAS. W. SIMMONS, with the Standard Oil Company, Cleveland, Ohio

"After a few days' study of your valuable work I changed my books from Single Entry (as they had been kept for 10 years) to your system of Double Entry, and am greatly pleased with it."—W. T. CHANDLER, general merchandise, Ash Grove, Mo.

Vertical Section The Mayo Damper.

—AMERICAN LIFE AND MANNERS.—Paul Bourget has been a close observer of American life and manners, but he has not succeeded in catching everything in the scoop net of his observation. There are some scenes and incidents of daily occurrence in our public thoroughfares which might well have attracted his attention and been deemed worthy of detailed description. Here is one which he is at perfect liberty to incorporate in his picturesque and vivacious description of America:

Two teamsters meet in a team crowded thoroughfare and their wagons come into collision.

First Teamster: "I beg your pardon."

Second Teamster: "Pray, do not apologize, sir; the fault was mine."

F. T.: "I think not. I was certainly to blame."

S. T.: "You are too good, sir. Permit me to back out."

F. T.: "I couldn't think of it. It is clearly my duty to give you the right of way."

S. T.: "Such kindness, sir, is overpowering."

F. T.: "Don't mention it, sir, I beg."

With the assistance of a police officer they succeed in extricating their teams from their entanglement and pass on with mutual expressions of good will.

The writer is aware that there are persons, captious, carping, cranky and critical persons, who will take exception to the form in which the foregoing dialogue is presented, and maintain that the following is a better outline of the character the conversation is likely to assume on such an occasion:

First Teamster: —— —— ——!! —— —— ——!!! —— —— ——!!!!

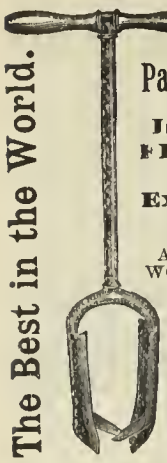
Second Teamster: —— —— —— —— ——!!!!!

F [illegible]: —— —— —— —— —— —— ——!!!!!!

After order is restored the teams are taken in charge by the police and the teamsters sent to the hospital in an ambulance.

But the people who claim that the latter is the more correct report of the colloquy are those who can see no good in our national life and are constantly finding fault with existing conditions.—*The Press.*

— A BRIGHT WOMAN.— Miss Wilted: "How many birthdays have you passed?"



Miss May Ture: "I haven't passed any since I was 24; I let them pass me."

MORE THAN HIS MATCH.

Oh, he could do anything, he said,
For he was supple of limb,
And kept on himself a level head
And ever was full of vim,
But he met his match in a folding bed,
Which closed one night on him.

—*The Press.*

— ITS PRINCIPAL DRAWBACK —"The trouble wid the sympathetic sthroike," said Mr. Dolan, "is thot the sthroike most always lashts longer than the sympathy."—*Washington Star.*

Effect of Temperature on Masonry.

Every one, says the Glasgow *Herald*, is familiar with the influences of temperature on all metals, but few realize the fact that on such immense masonry dams as that by which the waters of Thirlmere Lake, in Cumberland, England, are impounded for the future use of Manchester, there is a measurable daily movement due to night and day temperature. Mr. Deacon, engineer of the Liverpool Water Works, has been making a long series of records in connection with the dam across the Vyrnwy Valley by which an artificial lake was made two or three years ago for the supply of Liverpool. He had a 4½-inch hole bored through the masonry about the middle of the dam, extending from the top right down to a tunnel which pierces the dam 80 feet from the crest. A fine steel wire was passed through this hole, a heavy weight attached, and a seismograph, connected with the bottom of the wire, making a continuous record on the plate glass, the motions of the dam being magnified four times for the greater ease in reading. The maximum motion yet recorded owing to a change of temperature is 0.0144 inch, or about $\frac{14}{1000}$ inch. The filling of the dam from a level of 13 feet causes a deflection of 0.034 inch, or $\frac{34}{1000}$ inch.

An Impossible House.

The man and his wife called on the architect, and the architect was glad to see them, for business was extremely dull.

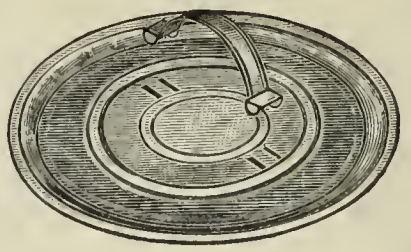
"We want you to build a house for us," said the man, by way of introduction.

"Thanks," bowed the architect, "I shall be only too glad to do so, and I am quite sure that I can give entire satisfaction."

"Well, you ought to," remarked the lady; "we don't want much."

"What kind of a house did you wish?" inquired the architect.

"We want a good plain one of about eight rooms," explained the man, "and we will leave the design to you. All we expect is that when you have finished it it will suit my wife and myself. I mean on the inside; we are not so particular about the outside."



The architect heaved a deep sigh.

"I am very sorry, he said, "but you will have to go to some other architect. We can't design an impossible house in this office."—*Detroit Free Press.*

A Distinct Improvement!

THE BUFFALO POT COVERS

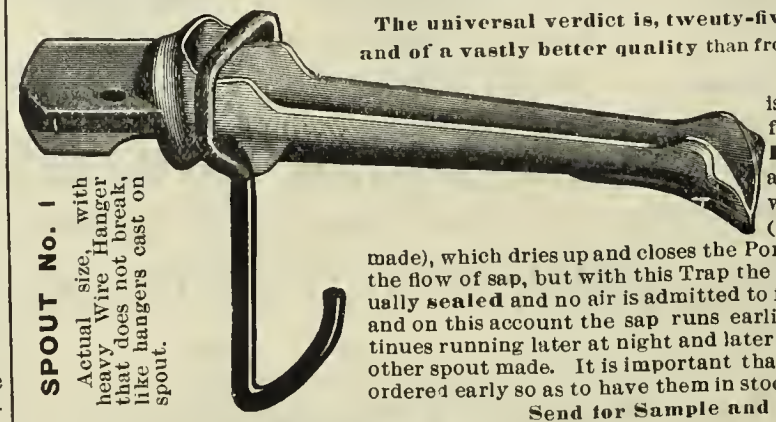
With Loose Attachable Handles.

With Loose Attachable Handles.

No woman likes a Pot Cover with a ring attached; she prefers a tin handle, but if the handles are soldered on the stock is an awkward one for the dealer and a dozen occupy as much room as a gross of the "Buffalo."

One dozen Covers and Handles packed in a neat pasteboard box, about an inch deep. Handles may be attached by any one instantly AS REQUIRED. Four slots, as shown in cut, are punched in cover, into which the tongues on the handles may be readily inserted and bent over on the under side, with the fingers, *securely* and *firmly* fastening the handle to the cover.

Make up an order from our catalogue (ask for one if you haven't one) and include a sample lot of these Covers.



SOLE MANUFACTURERS, Sidney Shepard & Co., Buffalo and Chicago.

CHAS. W. WELLS, New England Sales Agent, 19 Pearl St., Boston, Mass.

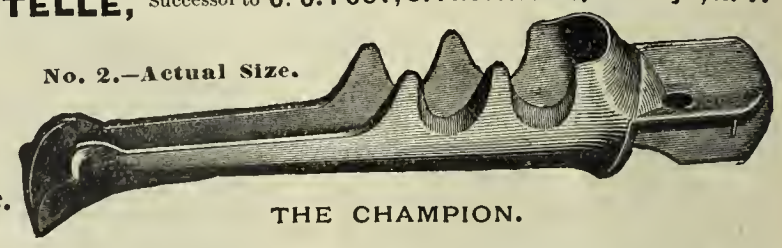
1895 - POST'S - IMPROVED - EUREKAS,

THE SUGAR MAKER'S FIRST CHOICE.

The only Sap Spout made with a Self Sealing Air Trap, which greatly increases the flow of Sap.

SPOUT No. 1 — Actual size, with heavy Wire Hanger that does not break, like hangers cast on spout.

The universal verdict is, twenty-five per cent. more sugar and of a vastly better quality than from any other spout made.



The **Patent Air Trap** is one of the essential features found only in the **Improved Eurekas,** and without which the air would be freely admitted (as it is in all other spouts made), which dries up and closes the Pores and materially lessen the flow of sap, but with this Trap the discharge hole is effectually **sealed** and no air is admitted to freeze or dry up the sap and on this account the sap runs earlier in the morning, continues running later at night and later in the season than any other spout made. It is important that these goods should be ordered early so as to have them in stock when the season opens.

Send for Sample and Circular,

CHARLES C. STELLE, Successor to C. C. POST, 81 Fifth Avenue, Brooklyn, N. Y.

Sold by the best Jobbing Houses.

No. 2.—Actual Size.

THE CHAMPION.

Rub! Rub! Rub!

Why permit your customers to continue in the old way of doing things, particularly the washing of clothes, when you can offer them a machine that will do the work in one-quarter the time, yet costing less than an outfit of common tubs boards, &c., would. To see the BOSS is to buy it. Send for descriptive circular and become acquainted with all its good features; it has no bad ones.

Tinned Nails and Red Cypress Wood ONLY used.

PURITAN WASH DOWN WATER CLOSET.

Best Closet Yet Produced for Either Public Places or Private Houses.

In presenting this Water Closet Apparatus to Architects and Plumbers and those interested in Sanitary Plumbing, will say that our aim has been to **Improve the Quality, Simplify the Construction and Reduce the Cost of Fitting in Place**, and we feel confident that we have done all this in the present Apparatus, and more too, **as it will discharge more matter, keep cleaner with less water and make less noise in the operation** than any Water Closet Apparatus now on the market.

The Closet is especially well adapted for Fire Proof Structures, as the Soil Pipe may be run above the floor, either behind or on the face of the finish. Another very good feature—a stoppage can only take place in the bowl (where it can be reached from the top). Anything that passes this point will not lodge in the Soil Pipe.

These Closets are made of Vitreous Earthen Ware—that is, an absolutely non-absorbing material, warranted not to craze. Each Closet is stamped with a Bull's Head, our trade-mark.

The tank is provided with a cover finished to match. This cover deadens the noise, prevents fouling by dust and also prevents malicious persons from getting at or throwing anything into the tank.

The tank is worked either by hand action or seat action.

The distance from top of tank to finish of floor is 2 feet 6½ inches. From face of wall to front of Closet, 2 feet 1¾ inches. Depth of seal in Closet 2¾ inches.

SEND FOR CATALOGUE.

Covert Pants Stretcher.

THE Covert "Pants Streteher" will restore the pantaloons to their original shape and length.

It removes all **WRINKLES and BAGGING AT THE KNEES,** giving them the appearance of having just left the tailor's hands.

It also holds the pants in a convenient position for brushing and cleaning.

The Streteher cannot get out of order, and can be adjusted in the pants in a few seconds.

It being applied inside the pants, it obviates all objections prominent in other stretchers.

It is made of steel wire, and being in sections can be packed in a valise when traveling. Sold by the trade, or

Sample pair sent by mail to any address, free of postage, on receipt of $1.00.

Principles and Practice of Plumbing.

By S. STEVENS HELLYER. With illustrations. 294 pages, price $1.25. Sent on receipt of price by

DAVID WILLIAMS, - Publisher & Bookseller,
96-102 Reade St., New York.

— IN THE SCHOOLROOM. — Teacher: "What is the largest city in the world?"

Scholar: "Chicago."

Teacher: "Oh, no; London is the largest."

Scholar: "I guess not, and I ought to know; we've got a Chicago drummer boarding at our house."—*Detroit Free Press.*

— JUDGE: "How do you account for the fact that the man's watch was found in your pocket?"

Prisoner: "Your Honor, life is made up of inexplicable mysteries, and I trust your honor will so instruct the jury."—*Puck.*

SECOND EDITION.

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING,

WITH THIRTY-FIVE ILLUSTRATIONS.

43 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published

Sent, post-paid, on receipt of price, 25c.

TRIMO PIPE WRENCH.

Forged Steel.

All Parts Interchangeable.

Grips firmly without loss of motion. Releases readily. Never locks. Causes no trouble in close quarters. Does not crush the pipe.

The chain holds securely; cannot fall out even if used upside down. Readily releases when desired. Solid forged head. Fine quality of tool steel. Interchangeable gripping jaws.

TRIMO GIANT WRENCH.
Strongest and safest Pipe Wrench ever made. No slipping; no locking; no lost motion.

TRIMO COMBINATION WRENCH. FOR NUTS AND PIPE.

TRIMONT MFG. CO., Roxbury, Mass,

The Climax Ratchet Stock

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

For sale by leading jobbers.

FOUNDRY PRACTICE.

The Encyclopedia of Founding and Dictionary of Foundry Terms,

used in the practice of molding. Together with a description of the tools, mechanical appliances, materials, and methods employed to produce castings in all the useful metals and their alloys, including brass, bronze, steel, bell, iron and type founding, with many original mixtures of recognized value in the mechanic arts. Also aluminum, plating, gilding, silvering, dipping, lacquering, staining, bronzing, tinning, galvanizing, britannia-ware, German silver, nickel, soldering, brazing, ores, smelting, refining, assaying, etc. By SIMPSON BOLLAND, Author of "The Iron Founder," "The Iron Founder" Supplement. 12mo.: cloth.....**$3.00**

The Pattern Maker's Assistant

Embracing lathe work, branch work, core work, sweep work and practical gear constructions, the preparation and use of tools, together with a large collection of useful and valuable tables. Sixth edition. By JOSHUA ROSE, M. E.; illustrated with 250 engravings; 324 pages; cloth.....**$2.50**

Modern Molding and Pattern Making.

A practical treatise upon pattern shop and foundry work. By JOSEPH P. MULLIN, M.E.: 257 pages; cloth; illustrated. **$2.50**

Iron and Steel Founding.

Illustrated with 39 diagrams. By C. WYLIE. Second edition, revised and enlarged; 324 pages; 8vo; cloth... .....**$2**

The Practical Brass and Iron Founder's Guide.

A treatise on brass founding, molding, the metals and their alloys, etc. By JAMES LARKIN, late conductor of the brass foundry department in the Penn Works, Philadelphia. A new revised and greatly enlarged edition. Contents: Among the most important and entirely new sections of this edition of this valuable and popular book are the following: Behavior of Metals and Alloys in Melting and Congealing; Malleable Iron Castings; Wrought Iron or Mitis Castings; Manufacture of Steel Castings; Casting of Brass; Casting of Bronze; Bell Founding; Chill Casting; Casting without Core; Casting on to Other Metals; Casting Iron and Other Metals Upon Lace, Emoroideries, Fern Leaves and Other Combustible Materials; Some Modern Bronzes. In one volume; 12mo; 400 pages.....**$2.50**

American Foundry Practice.

Treating of loam, dry sand and green sand molding, and containing a practical treatise upon the management of cupolas and the melting of iron. By THOMAS D. WEST, practical iron molder and foundry foreman. Fully illustrated. Eighth edition, revised. 408 pages; cloth.....**$2.50**

The Iron Founder.

A comprehensive treatise on the art of molding, including chapters on core-making, loam, dry sand and green sand molding, also crystallization, shrinkage and contraction of cast iron and a full explanation of the science of pressures in molds, added to which are formulas for mixtures of iron, tables, rules and miscellaneous information. By SIMPSON BOLLAND. Illustrated with over 300 engravings. 12mo, cloth....**$2.50**

The Iron Founder Supplement.

A complete illustrated exposition of the art of casting in iron, comprising the erection and management of cupolas, reverberatory furnaces, blowers, dams, ladles, etc., mixing cast iron, founding of chilled car wheels, malleable iron castings, foundry equipments and appliances, gear molding machines, molding machines, burning, chilling, softening, annealing, pouring and feeding, foundry materials, advanced molding, measurement of castings, wrought iron, steel, etc. Also the founding of statues, the art of taking casts, pattern modeling, useful formulas and tables. By SIMPSON BOLLAND. illustrated with over 200 engravings; 400 pages; 12mo; cloth..... ...**$2.50**

IS IT RIGHT?

Is it right to presume that the metal workers of America do not know the difference between common galvanized iron and good galvanized iron? We don't think so.

Would it be right to take advantage of that ignorance, even if it did exist? We don't think so.

Is it wise to conduct a business on that sort of a basis? We don't think so.

Taking advantage of other people's lack of expert knowledge is mighty poor business. Very few of us but have to take other people's words for things we are not wholly familiar with. Are we "fair game" for imposition because we depend on other folks' honesty? As a matter of fact, metal workers do know the difference between poor iron and good iron. They may be imposed upon once in a while because they believe in the dealer's honesty and do not watch him, but sooner or later they will find out the imposition, and then the dealer will be sure to lose their trade forever.

A dealer or manufacturer who sells inferior goods on the representation or with the understanding that they are first-class, is not a safe man to deal with. If he will sell a single sheet of iron that way, look out for him on a car load.

When we sell "Star Best Bloom," we guarantee it perfectly flat, full weight without variation, and absolutely true to gauge. It's the best grade of galvanized sheets we know how to procure. Doubtless, unscrupulous persons can occasionally sell inferior sheets at the price of the "Star." Doubtless they would make a little bigger profit on that one sale, but the big profits that result in lost trade are not so very profitable after all.

For a certainty of quality and an absolute guarantee of grades, address

Hicks' Guide FOR Builders,

Comprising an easy, practical system of Estimating Materials and Labor for Carpenters, Contractors and Builders.

A comprehensive guide to those engaged in the various branches of the building trades.

By I. P. HICKS.

160 Pages, - 114 Illustrations.

Bound in Cloth, Price, - $1.00

This book presents to the trade, first, an easy, practical system of estimating materials, in concise form for reference. In the next place is given the average day's work of all kinds, and the average rates on which to figure in almost every detail of building construction.

Material and Labor, including Lumber, Carpentry Work Masonry, Plastering, Hardware, Painting, etc., are among the principal divisions These in turn are illustrated and ably treated under numerous sub-divisions, showing step by step the entire work of estimating, contracting and building, together with the best and most practical methods of doing the work.

This is followed by a section given to the Geometrical Measurements of Roof Surfaces with numerous illustrations and examples. It embraces a new and simple system of framing curved roofs, also the simplest methods of roof framing of every description, with practical examples thoroughly illustrating nearly every conceivable form of roof and showing many points never before presented.

The volume also contains a chapter on Mitering Planccers, Moldings, etc., illustrating and describing how to make, in an easy, practical manner, many joints which are the source of no little trouble and annoyance on the part of the workman.

A Rat Completed the Circuit.

A singular accident, which occurred recently at an electric light plant in Baltimore, is thus described in a press report from that city: A rat played hob with the Brush Electric Light Works late on Thursday night. At the time the employees were unable to find the trouble. About midnight the lights went out at one station of the city. At the same time the switchboard and the connecting wires in the works were ablaze, and when the display ended the entire board was a wreck. It was not until after an investigation that the explanation presented itself. The rat, in skipping along from one brass terminal to another of an entire circuit of lights, had made a connection and circuit between wires that were intended to be kept apart. Each one of the brass fixtures was connected with two wires charged with opposite kinds of electricity. The rat had his hind feet on one fixture, and when his front feet touched the brass 2700 volts of electricity passed through his body, a sufficient voltage to produce 1000 horsepower. The rat was wet, and the body became rigid as if frozen in the act of stepping across from one brass piece to another. The remains of the rat are preserved at the works. So lifelike is the attitude of the rat that at a little distance one would think it a live rat in the act of jumping.

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This hapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstrat on is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

THE KEENE FOOT POWER

CORNICE BRAKE.

EASIEST TO OPERATE, STRONGEST AND BEST.

Sheet Metal Working Machinery of all Kinds.

GEO. C. KEENE & CO.,

Cincinnati, O.

AGENTS:

Hibberd & Spinner,
9 Cliff St., New York

Holder & Herrick,
49 Broad St., Boston, Mass.

Ledwidge & Co.,
234 Lake St., Chicago, Ill.

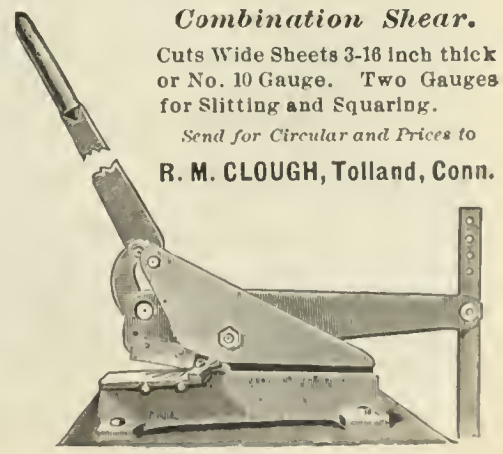
PRESSES, DIES AND TOOLS

For Can and Tinware Manufacturers.

Dies for Cutting, Drawing & Stamping Tinware

Estimates given at sight of samples of drawing work.

Send Sample for Prices before ordering elsewhere.



DOVER MACHINE WKS., Dover, Del.

Combination Shear.

Cuts Wide Sheets 3-16 inch thick or No. 10 Gauge. Two Gauges for Slitting and Squaring.

Send for Circular and Prices to

R. M. CLOUGH, Tolland, Conn.

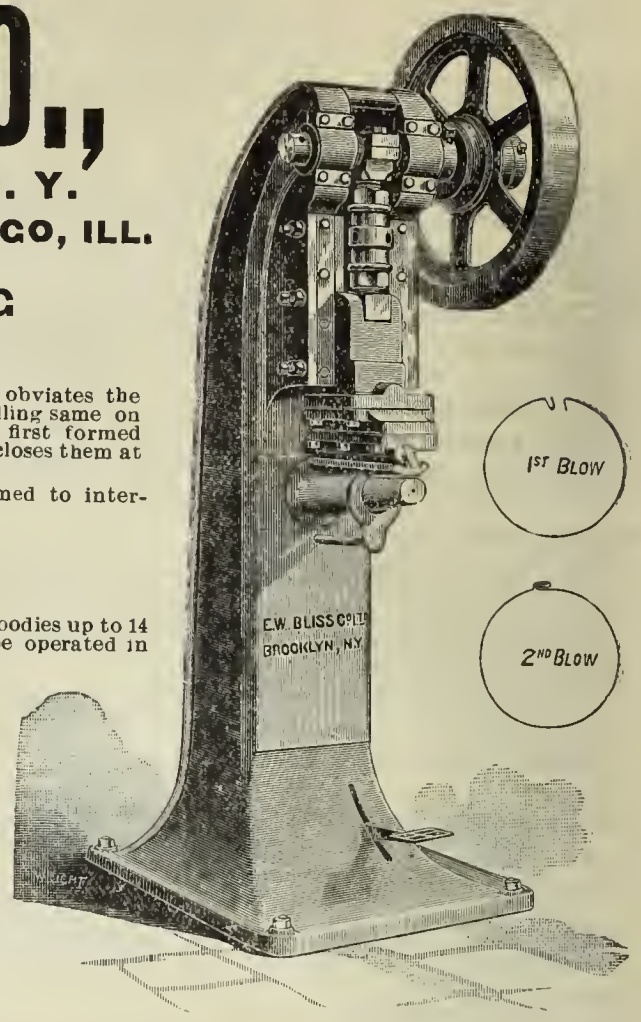
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

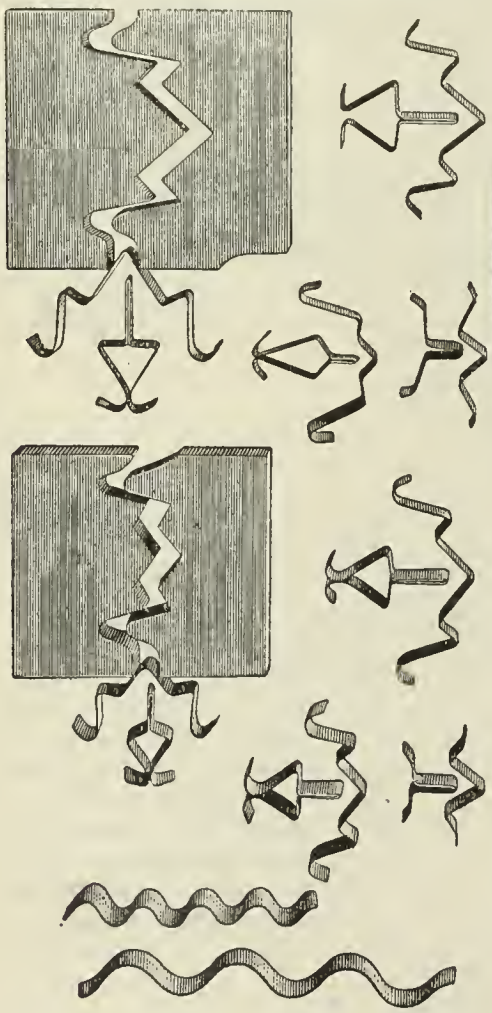
Second—That both edges are hooked at one blow.

Third—That the hook forming and closing are done in one handling.

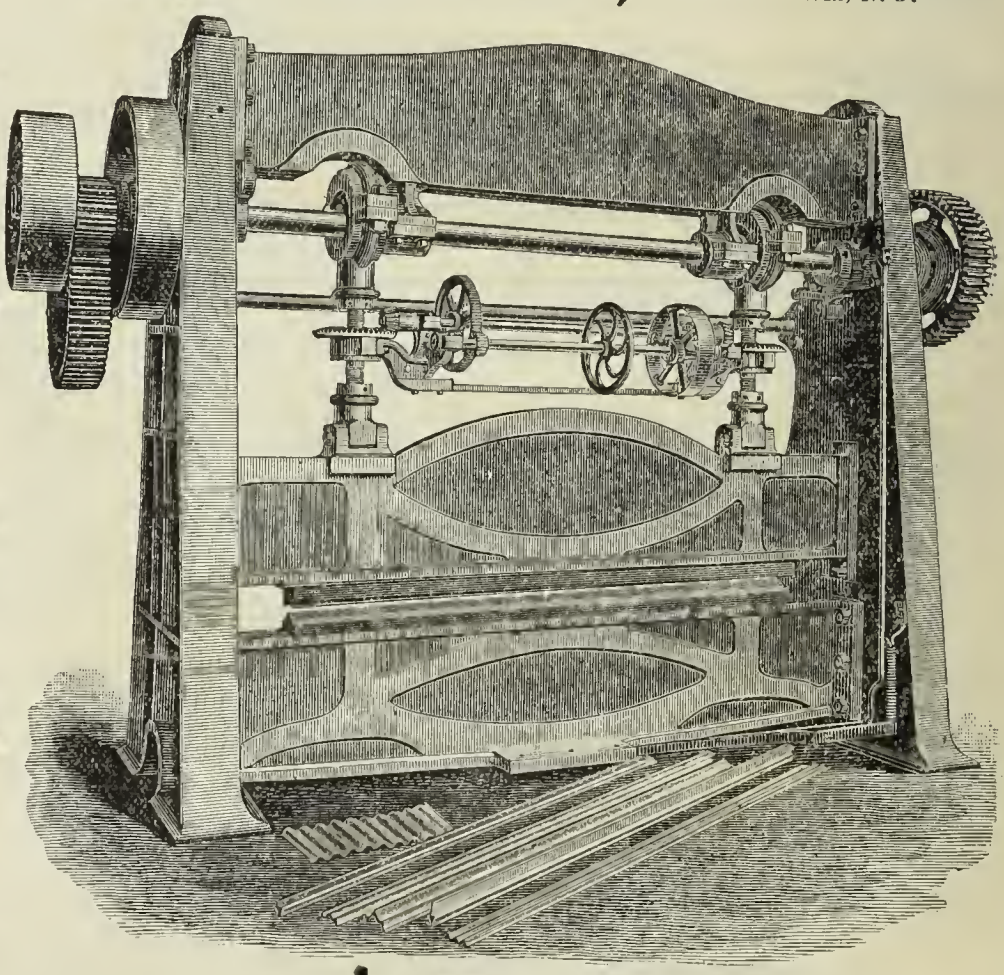
Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.

PRESSES, PUNCHES, SHEARS,



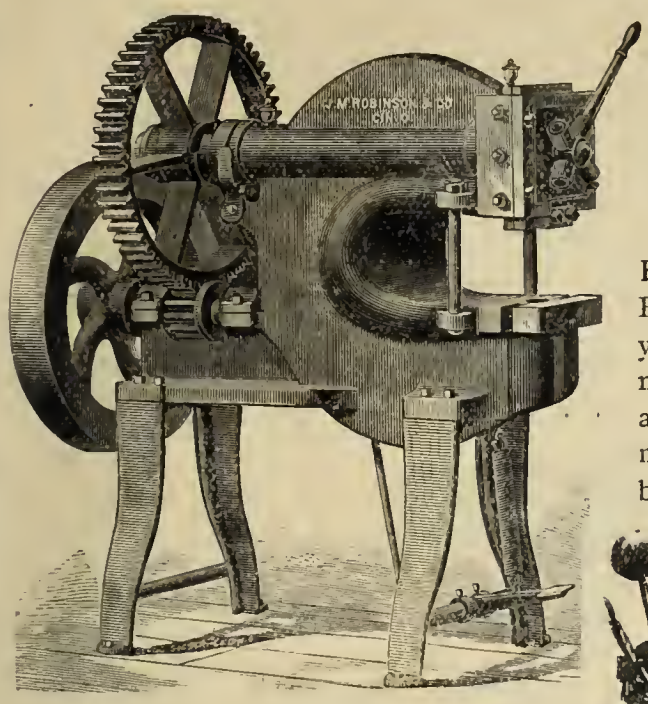
DROP HAMMERS,



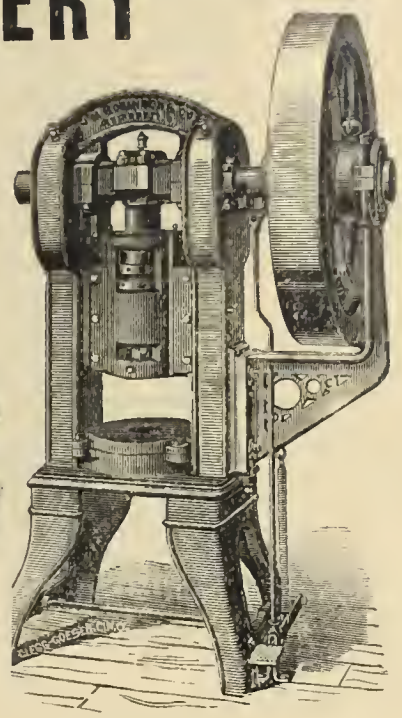
DIES, SPECIAL MACHINERY, &c.

THE STILES & PARKER PRESS CO.

GEO. A. OHL & CO., 157, 159, 161 Oraton Street, NEWARK, N. J.

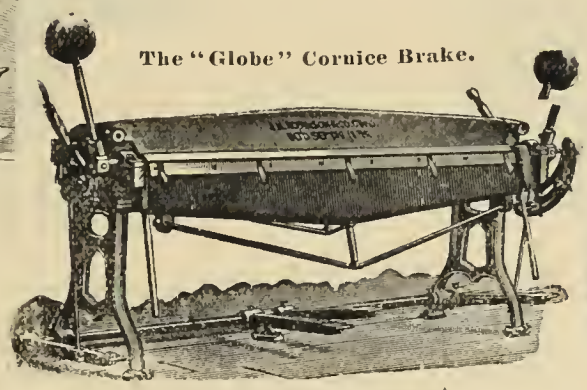


SOME SAMPLES OF WORK PRODUCED ON THESE MACHINES.



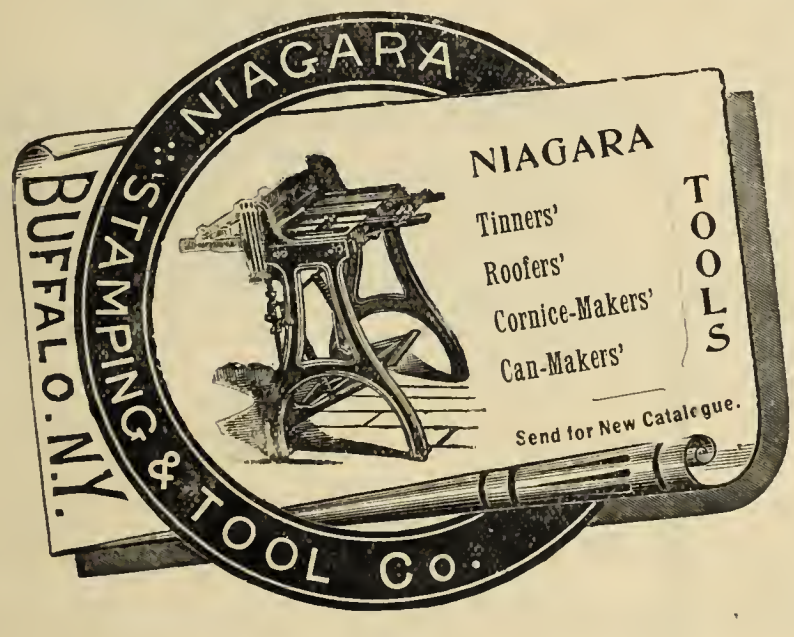
Improved Sheet Metal Power Press.

The above cut represents a ten foot power press weighing 20,000 pounds. This machine will make a skylight bar seven (7) bends at once of No. 24 iron, corrugate as heavy as No. 14 iron, also will press out mouldings of any shape that can be pressed between two dies. It is provided with a special mechanism for raising and lowering the hammer, with the die holder and die, to suit the different heights of the latter.

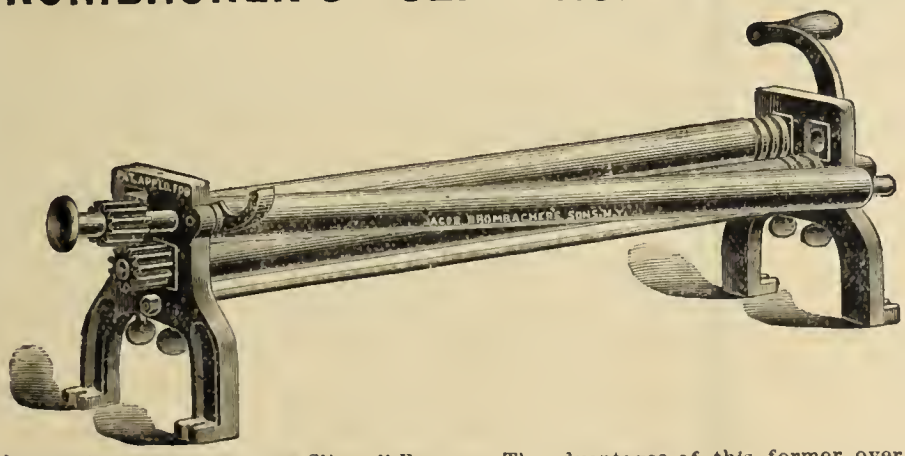


DO YOU USE POWER MACHINERY

For working Tin, Galvanized Iron, Brass, Zinc or Copper Sheets? If you do, we make a specialty of machinery for this purpose. We also make hand and foot power machinery to do the same work, but lighter, of course. Write us.



The "Globe" Cornice Brake.



J. M. Robinson & Co.,

CINCINNATI, O.

BROMBACHER'S SLIP ROLL FORMER.

Above cut represents our new Slip-roll Former. The advantages of this former over ordinary formers are

First, that the rollers are made of cold rolled steel rolls.

Second, it has cut gears with consequent smoothness of operation.

Third, the thumb screws are inserted from underneath, consequently the box carrying the rollers rests on the screws instead of the screws carrying the boxes and rollers; this obviates the possibility of breaking thumb screws.

Fourth, we do not have to split one frame in order to obtain the slip-roll mechanism, and we therefore have all the rigidity of ordinary formers with all the convenience of slip-roll formers.

Above design makes the smoothest and quickest operating and stiffest Former on the market and they are sold at the price of ordinary Stove Pipe Formers.

JACOB BROMBACHER'S SONS - - No. 30 Cliff St., N. Y. City.

Established 1833 Incorporated 1887.

The Laws of Business

FOR ALL THE

States and Territories of the Union.

By THEOPHILUS PARSONS, LL.D.

864 pages, 6 x 9 inches; full leather, **$4.50.**

Contains information of the highest value to business men, treating fully and clearly of contracts, sales, agency, agreements and assessments, stoppage and transitu, considerations, limitations, notes and bills of exchange, interest and usury. Embraces chapters on commercial law in general, bonds, assignments, guaranty, the statute of frauds, receipts and releases, payment, partnership, arbitration, carriage of goods and passengers by railroad and other carriers, hotel keepers, patents, copyrights, statute of limitations, the law of place, shipping, marine, fire and life insurance, deeds of land, mortgages of land, mortgages of personal property, leases, liens of mechanics and material men, the recovery of debts, wills, executors and administrators, guardians, and the legal rights of farmers, &c. Also abstracts of the laws of all the States and Territories relating to the collection of debts, usury, the execution and acknowledgment of deeds, witness required to wills, holidays and days of grace, mechanics' liens, chattel mortgages, and nearly 300 approved forms which have been tested in courts.

The Metal Worker Essays on House Heating by Steam, Hot Water and Hot Air.

WITH INTRODUCTION AND TABULAR COMPARISONS.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

How to Effectively and Economically Heat a Given Building

is a problem of the highest importance to the Architect, Builder and Owner. Shall steam, water or air be employed as a medium? What are the relative merits of the different systems? By what means can a comparison be instituted that will show their respective advantages?

The essays comprised in this volume are some of the results of a prize contest conducted by *The Metal Worker* some time since. They include the prize essays and selections from the best of the others. The foundation of all the essays is a house, the floor plans and elevations of which were the result of previous competitions conducted by *Carpentry and Building*. The elevations and the plans of this house were carefully printed on separate sheets adapted to receive at the contestants' hands lines indicating the position of heater, runs of pipes, location of radiators, etc., thus insuring a uniformity in presentation, and also holding the competitors to exactly the same conditions. The result, therefore, is a book in which are shown: First, different means of heating the same house, among which may be instituted various comparisons, and, second, several different interpretations of each of the several methods, among which also instructive comparisons may be instituted.

The work is not a mere theoretical consideration of principles and a statement of facts gained by inquiry in the trade; but, instead, a collection of essays by practical men, each showing how one man would go about heating the building in question, using the means with which he is best acquainted in practice. Features of the book which are not the least important among its numerous merits are the *lists of items and statement of cost* accompanying the different essays. Never before in the history of the heating trades has there been offered such a collection of information directly from the practice of those who are actively engaged in the heating business as is contained in this volume.

"The whole forms a valuable and instructive exposition of current practice in house heating."—*American Machinist.*

"Covers the ground very completely."—*Scientific American.*

"It will be found as complete a compendium as possible of existing information on this subject, amply illustrated by drawings."—*The Sanitary Era.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume. Price, $3.00.

Apollo Best Bloom

There is great difference in galvanized iron.

You can always get flat sheets and workable iron, if you buy of a first-rate jobber. No jobber that has any careful trade could hold it without the Apollo brand.

There are three reasons for selling common iron: (1) it costs less by the ton, and generally is sold for the same in small quantities; so the profit on it is greater; (2) it is good enough for some uses; (3) and many metal-workers don't know the difference.

The difference is: the Apollo is flat (no buckling) and soft (no breaking when bent) and true to gauge—(no loss in buying by weight and selling by measure.).

Milton Rogers & Sons, Omaha, Neb.

DEALERS!

All Weak Points About Vapor Stoves

are not called to your attention by unscrupulous manufacturers or their salesmen. They often palm off imperfect and faulty stoves as perfect, and jolly you into the belief that you have struck a bargain.

But when summer comes and truth comes to light, as it invariably does in the vapor stove business, vexation and disappointment come with it. Vexation, because you have been duped, disappointment, on account of the loss of a season's profit.

Better handle a *good line* at a fair profit than a *poor* line at a *bargain* profit. There is no such thing as a "bargain," especially in the vapor stove business. *Proof*—Review the past ? ? ?

Better buy from a responsible manufacturer or his legitimate jobber, especially of one whose integrity is unquestioned, and one whose knowledge of the vapor stove business secures you an honest deal and prevents the imposition of fakes or shoddy goods. *There are a few of us left.*

Better buy a good line to be successful. A *bad* stove is a very poor purchase at *any* price.

Better look for Protection.

Protection in order to be of service to you must begin at home. See that this point is not overlooked when casting about for a line for 1895.

Better think this over.

The old adage reads, "Make Haste *Slowly*." This is a weighty proverb. The more so when you consider that the best versed manufacturers in the vapor stove industry are not offering any new inventions or innovations for the coming season.

Yours respectfully,

HOW TO REDUCE NATURAL GAS BILLS.
THE "PITTSBURG" GAS STOVE DOES IT.

Pronounced by Experts and Users to be the Cheapest, Best and Most Economical Gas Stove in the market. The secret of its success is not only in burning the gas perfectly, but in preventing any of the poisonous gases (the waste product of combustion) from escaping into the room, and yet extracting all the heat from the gas. **No waste heat passes into the chimney, but only the waste product of combustion.**

By making slight changes in burner this stove can be used for Artificial Gas also. If wanted for such purpose, please order "for Artificial Gas."

Full information cheerfully furnished. Manufactured exclusively and **for jobbing trade only,** by

A Warning to Wearers of Bicycle Suits.

"I have just called, Miss Hainge," said the angry lover, "to say farewell, but before I say it I want you to know that I have discovered your falseness and I despise you for it."

"Why, William, whatever is the matter with you?"

"Oh, you know well enough. Perhaps I didn't pass the gate last evening and see you with your head on another man's shoulder."

"But, William, I haven't seen any man but you, dearest. Honestly, I haven't."

"No, I suppose not. Then maybe I am blind, deaf and dumb and an idiot. Maybe you didn't have company last evening?"

"No one, William, but my friend Winifred. No. I didn't, and I think you are a wretch."

"And you didn't stand at the gate?"

"Oh, yes, we did. We were counting the stars—making wishes of them."

"Oh, yes. I suppose I was blind. Now perhaps you'll describe Winifred to me."

"Why, she had on her felt hat, her black bicycle suit, white shirt front, with a black satin tie and a white duck vest. You know Winifred, William?"

"Um-m, I see," he murmured. And what might have been a modern tragedy was averted, and William made it up on the spot."—*W. J. Press.*

WHY IS IT
that the same dealers who sold the **Boomer Furnace** five years ago are still continuing its sale?

DID YOU EVER STOP TO THINK
that one or two years' experience with a poorly constructed light furnace always creates a demand for a furnace that has proven to be the best in the full sense of the word?

IF YOU WANT TO MAKE MONEY
buy the Improved Boomer Furnace, set it up right, please your customer, and you have the key to your future success.

REMEMBER
that a Boomer Fire Pot has never been known to crack or burn out. That it has the simplest and most effective Gas and Smoke Burner. Guaranteed the heaviest Furnace made. 84-page catalogue sent free to all responsible dealers.

HESS, SNYDER & CO., MAKERS. Massillon, Ohio.

Ocean Depths.

Murray and Penck had made calculations by variations of the first method, and got out the mean depth of the oceans as 3797 meters (2074 fathoms), and 3650 meters (1995 fathoms) respectively. Heinrich, by the second method, got 3438 meters (1881 fathoms), and Krümmel, by the third method, gave the figures 3320 meters (1815 fathoms). Since Krümmel's calculations were made, in 1886, his student, Karstens, has gone over them, taking advantage of the very numerous additional soundings which have been made, and he comes to the conclusion that the average depth of the oceans, as a whole, is 3496 meters, or 1909 fathoms. The maximum probable value was 3632, and the minimum 3377 meters. The mean depth of the Pacific Ocean is given as 3829 meters, of the Indian Ocean 3593 meters, and of the Atlantic Ocean 3160 meters.—*Nature.*

— "Who was Washington's father, Jack?" asked the teacher.

"The grandfather of his country," replied Jack.—*Harper's Young People.*

— "So it's all over between us, is it, Laura?" asked George, fiercely.

"Yes, George, it is over," replied Laura. "I would'nt have minded your flirting with all the girls some of the time or with some of the girls all the time, but I object to your flirting with all the girls all the time. Here is your ring."—*Chicago Tribune.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of these best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

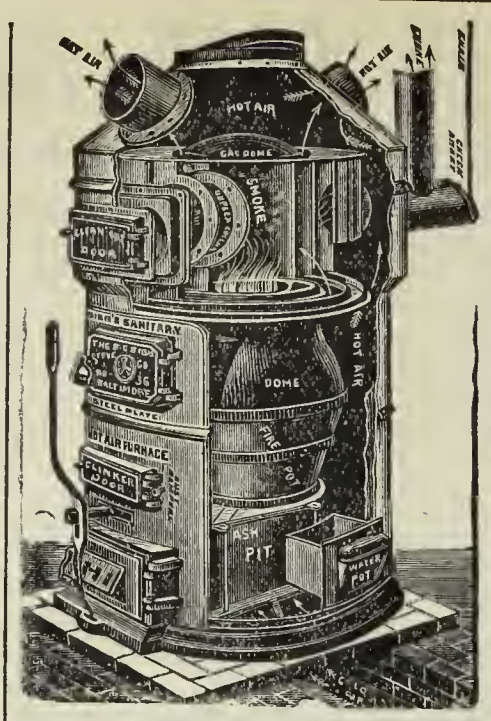
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

War's Perfectly Outrageous Front.

"He was a cool man, was the Colonel of my regiment," remarked a long-legged old chap to a militia youth in a great display of uniform. "I never seen his like."

"Was it in the late war?" inquired the youth.

"The same, and he was the dandyfiedest little fellow you ever see. That's the reason I don't laugh when I see you fellers," added the old one, encouragingly. "Clothes ain't no sign of what kind of a soldier is inside of them."

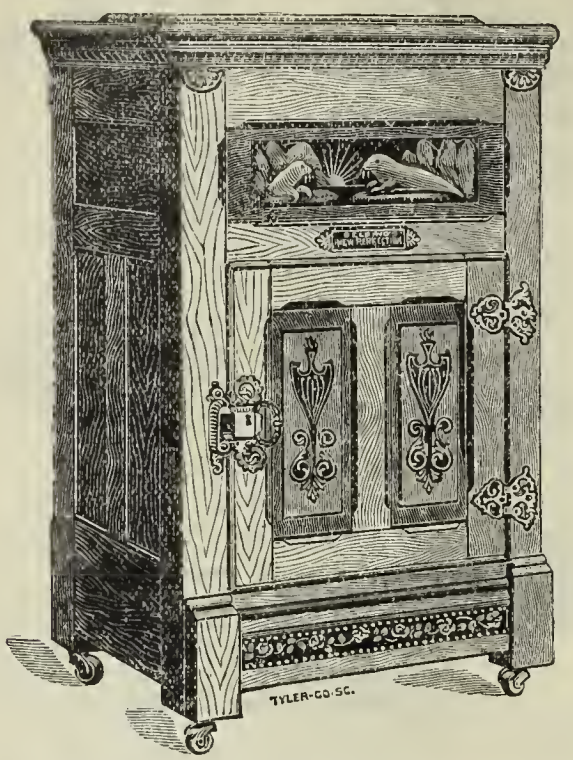
"Thanks."

"Don't mention it. As I was saying, my colonel was the coolest man you ever see. Down there before Richmond once, when he was only a captain, he had his company covering a hill that was in the range of the enemy's shells, and they was dropping them there thicker'n potaters. He had on a brand new uniform, and was looking like a beau on parade, but he stood right out where the shells was ploughing up the ground all around him and throwing dust over everything, but he never moved except to knock the dirt off his clothes about every minute. After a while the general in command sent for him to come back out of range behind the hill-top.

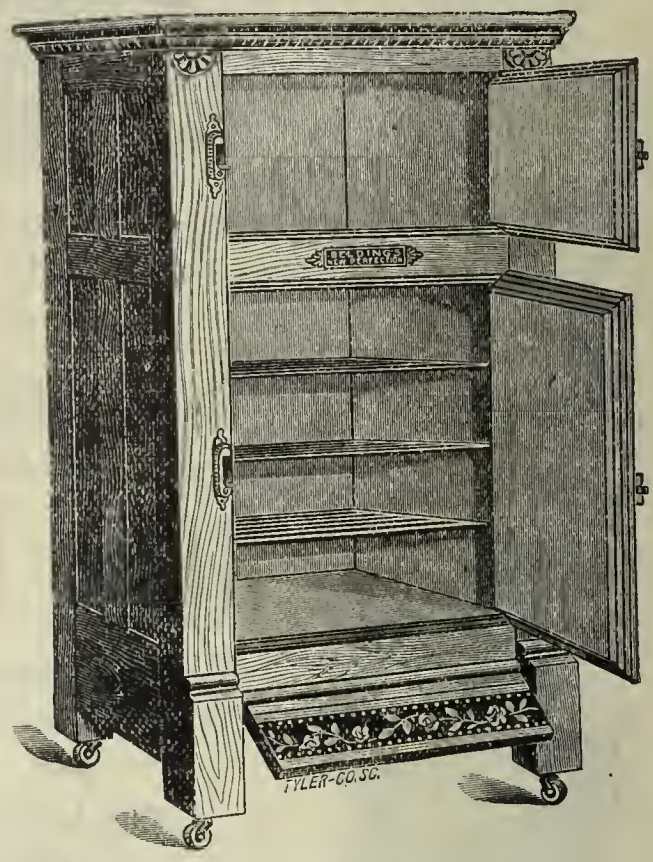
"'What do you think of it?' asked the general, meaning the outcome of the fight.

"'It's perfectly outrageous, general,' says the captain, 'and I don't see why in thunder they don't throw whisp brooms with their shells.'"—*N. J. Press.*

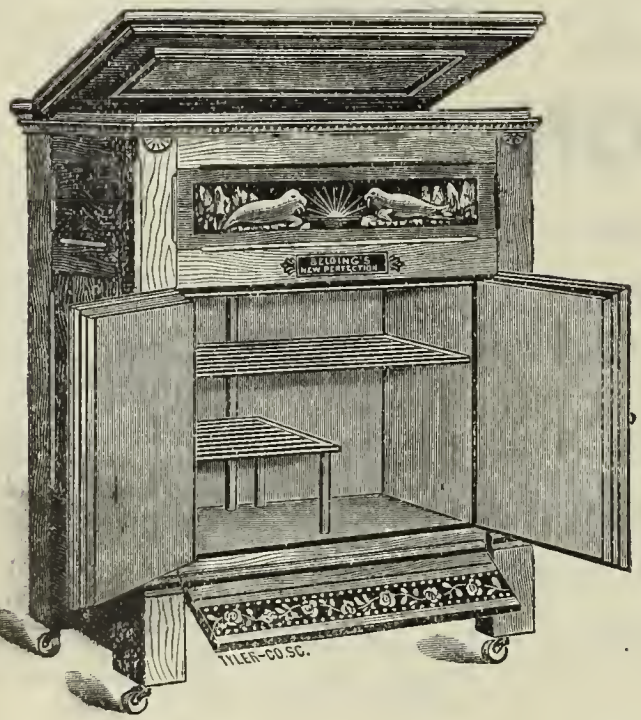
Keep at it.



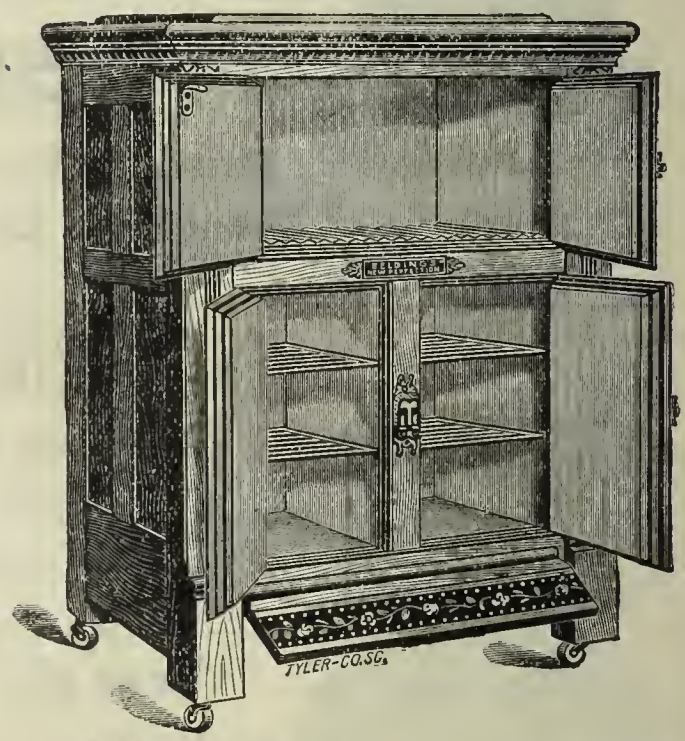
If you expect to conquer
In the battle of to day,
You will have to blow your trumpet
In a firm and steady way.
If you toot your little whistle
And then lay aside the horn,
There's not a soul will ever know
That such a man was born.



The man that owns his acres
Is the man that plows all day;
And the man that keeps a humping
Is the man that's here to stay.
But the man that advertises
With a sort of sudden jerk
Is the man that blames the printer
Because it didn't work.

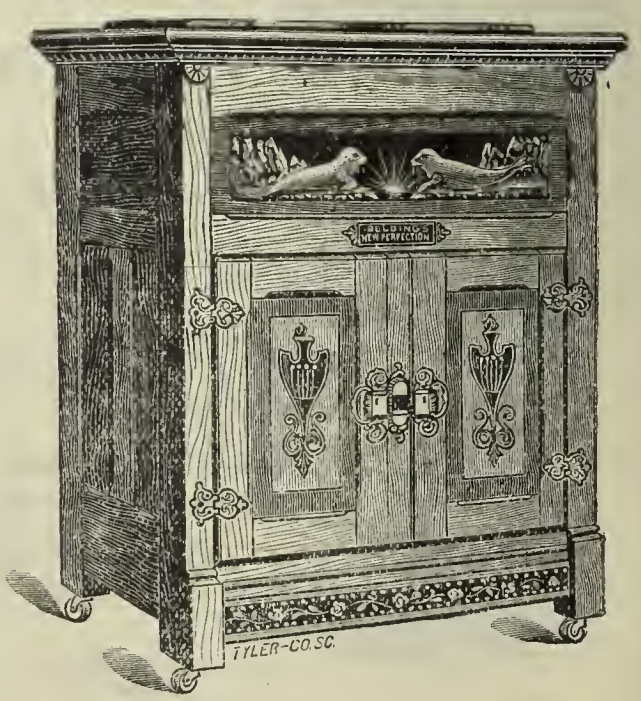


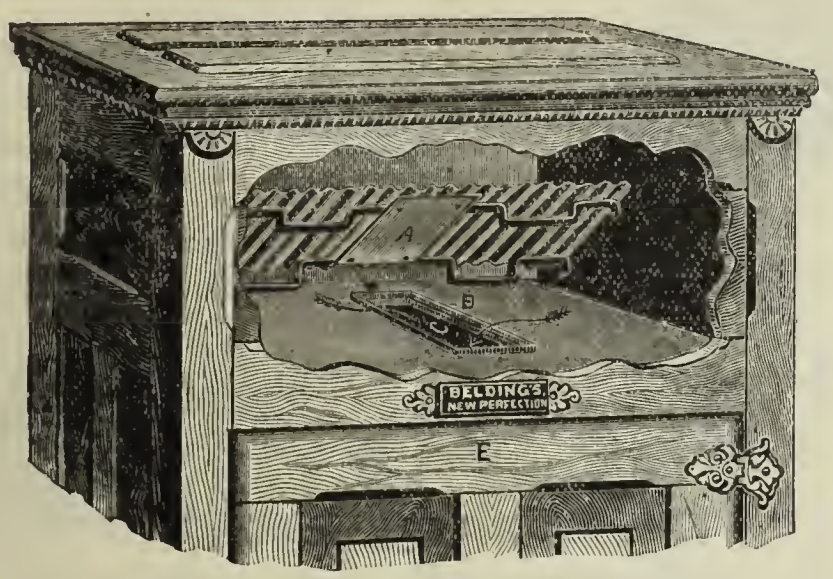
But the man that gets the business
Uses brainy printers' ink,
Not a clatter and a sputter,
But an ad. that makes you think;
And he plans his advertisements
As he plans his well-bought stock,
And the future of his business
Is as solid as a rock.

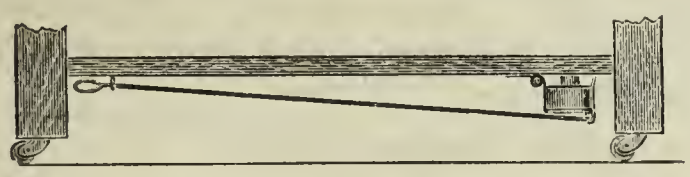


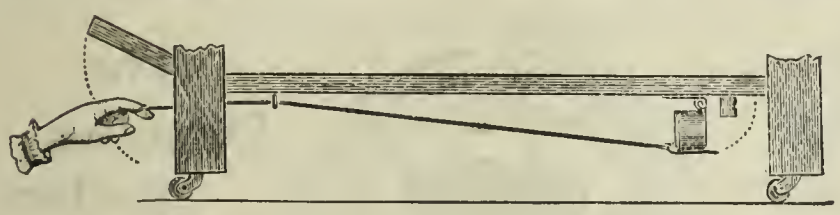
Printer's Ink.

BELDING'S REFRIGERATORS.





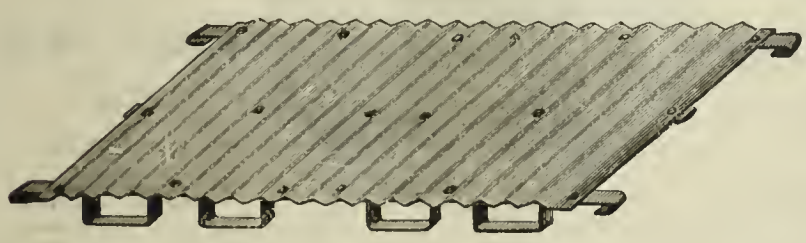




See Points of Excellence Over Others.

Patent Applied For.

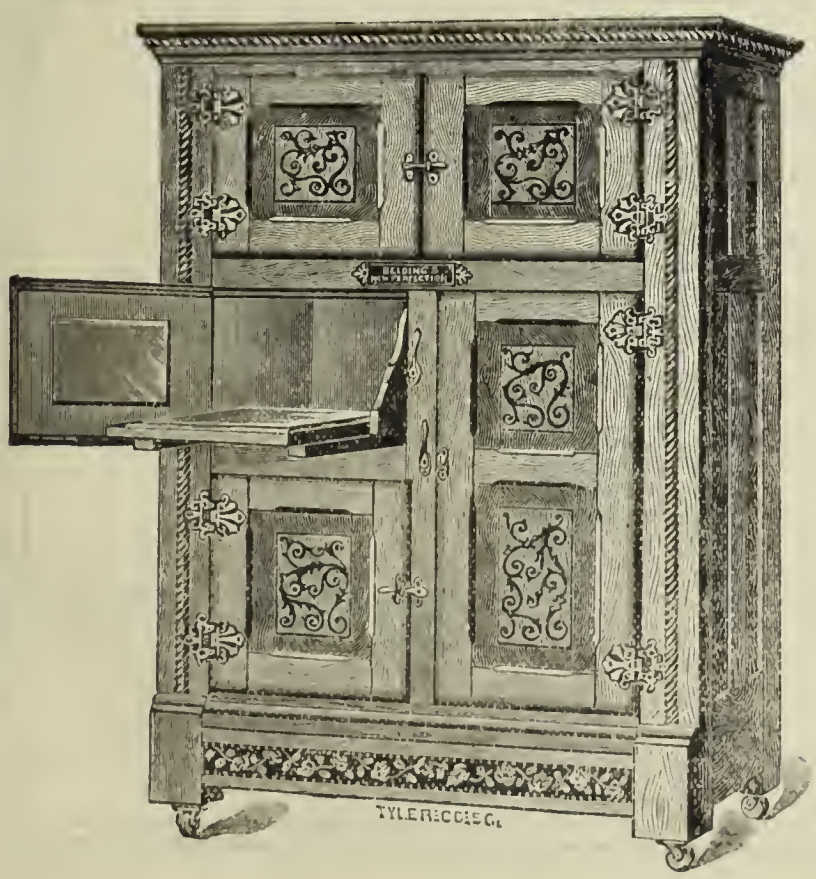
OUR NEW AUTOMATIC COLD AIR DAMPER ATTACHMENTS.



This cut shows a section of our Refrigerator with the New Automatic Cold Air Damper closed.

A—Represents Metal Ice Rack.
B—Bottom of Ice Compartment.
D—The **New Automatic Cold Air Damper.**
E—Door of Provision Chamber.

When the door of the Provision Chamber is opened the Cold Air Damper *immediately* closes the opening through which the cold air drops, thereby *instantly stopping the circulation* in the Refrigerator. Then, as the cold air in the Ice Compartment *cannot escape*, it is impossible for warm air to enter it through the flues in the sides of the Refrigerator; therefore, while the door of the Provision Chamber is open *no ice is wasted, no cold air escapes* and *no warm air enters* the Ice Compartment or *comes in contact with the ice.*



Thus it is clearly shown that this improvement is a *practical* one and makes our Refrigerators *consume less ice* than any that are now on the market.

OUR NEW DRIP CUP ATTACHMENT.

SOLID METAL ICE RACK.

No wood cleats to get water soaked and tainted.

All refrigerators **hardwood, antique finish.** We carry large stocks at all of the following places:

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth, Price, $1.00

The book is well got up and the information well given Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

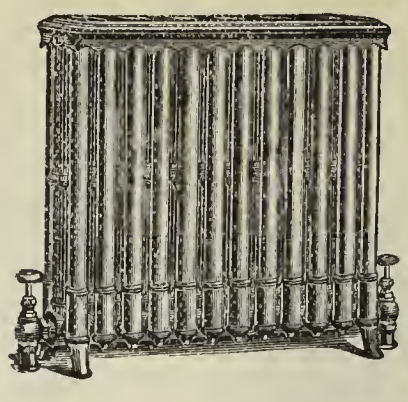
The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*



Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome —*Plumbers' Trade Journal.*

The Dunning Boilers ARE MADE OF Wrought Iron or Steel AND HAVE NO Packed Joints.

The Portsmouth Stove and Range Co.,

Portsmouth, O.,

beg to inform the trade that they have purchased all the soft coal Retort "DENMARK" Patterns of the Ransom Stove Works, Albany, New York, and all the "LION" Retort Patterns of the Favorite Stove & Range Co., Piqua O.,

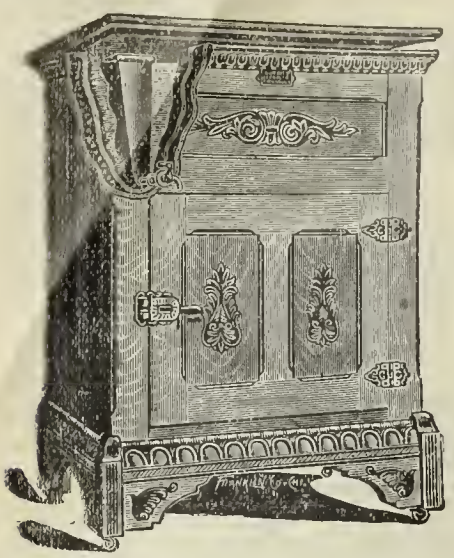
Makers of The Celebrated "Model" Steel Ranges,

and now own all the patents covering these constructions, and will have some novel things in heaters ready for the trade next fall, based on this method of burning soft coal.

Repairs for both of these stoves can now be purchased from us.

IMPORTANT ANNOUNCEMENT.

To Our Patrons and the Trade Generally:



Our new Catalogue for 1895 will be ready for distribution within a few weeks. We take this means of announcing in advance of its publication that we have very carefully studied the requirements of the trade in every particular, and that our lines will be complete. We will place on the market specialties in entirely new goods that will commend themselves both by reason of popular prices and their many attractive and desirable features. In addition to our very popular Oilgas Cook Stoves, containing our improved 1895 Burners that are giving such perfect satisfaction, we have something entirely new in the line of special Lamp Stoves at special prices; also Sheet Steel Circular Burner Oil Cook Stoves. Write for further information and prices.

CENTRAL OILGAS STOVE COMPANY,

—Manufacturers of—

Gas, Oil and Oil Vaporizing Stoves and Fixtures. Over 200 different styles and sizes for Cooking and Heating purposes.

BOSTON, NEW YORK, CHICAGO, SAN FRANCISCO.

Gurney Patent REFRIGERATORS.

WE CLAIM FOR THE "GURNEY:"

"REMOVABLE GALVANIZED ICE COMPARTMENT."
"THE ONLY CLEANABLE REFRIGERATOR."
"CAN BE KEPT ABSOLUTELY PURE AND CLEAN FOR ALL TIME."
"THE LOWEST AVERAGE TEMPERATURE."
"THE GREATEST ECONOMY OF ICE."
"DRY AIR FREE CIRCULATION"
"PACKED WITH MINERAL WOOL (the best non-conductor.)"
"THE GREATEST SELLER."

The "Gurney" Proves what we Claim.

The following Jobbers will handle the Gurney for the Season of 1895:

S. M. Howes & Co., Boston, Mass.
A. W. Martin, Baltimore, Md.
Supplee Hardware Co., Philadelphia, Pa.
Bindley Hardware Co , Pittsburgh, Pa.
Frank Diel, Syracuse, N. Y.

The Passing of the Depression.

The New Year starts out with many evidences of improvement as compared with 1894. The most important of these is the increased employment now being given to workingmen. A year ago "the army of the unemployed" was a significant phrase, as every community had its contingent of idle men, who were so numerous and so necessitous that their existence was a menace to the public peace. Thrifty and industrious men, who had scarcely known a day of enforced idleness, found themselves utterly unable to secure work at any rate of wages and were compelled to subsist on charity. The public soup house was for the time a national institution. But since then a very great change has occnrred. Disheartened bnsiness men and discouraged manufacturers have made a fresh attempt to do something and have gradually brought about a much more active condition of general trade. Thus idle workingmen have again been furnished with employment, and few localities can now be found with any considerable number of unemployed, except from choice. Charitable organizations are continued, as they are needed in even the most prosperous times, but the class of people dependent on them is wholly unlike that of last winter.

Employment of Labor.

The distinct gain that has been made in this respect, which is of prime importance to the welfare of the nation, is apt to be overlooked in the dissatisfaction felt at the unprofitableness of business. But it shows that a very great stride has been taken in the direction of a complete recovery from the depression. The masses of the people must be employed to insure consumption of goods, and all sorts of products must be freely consumed to keep the wheels of commerce moving. The inflnences which dominate business are now moving in the right way, and will necessarily continue to gather strength as they so move. The employment of additional men in one branch of industry enables more to be employed in other branches. That this movement is proceeding very satisfactorily is shown conspicuously in some instances which are, of course, exceptional. One of these, which happens to be in mind at the instant, is that of a large manufacturing concern, perhaps the most extensive in the country in its line, which had jnst completed an important addition to its plant when the panic of 1893 set in. The works were run with a light force for the remainder of the year and for the greater part of 1894, the new part being wholly unused from its completion. At the present time the entire establishment is running, including the new part, and the force of workmen employed is greater than ever before.

The Brightening Future.

No stronger evidence could be presented to prove that business is adjusting itself to the new conditions brought about by the great fall in values of the past few years, and particularly of the last eighteen months. It can safely be assumed that in the great majority of establishments now in operation methods have been or will be instituted whereby at least reasonable profits will be assured. The first great step is at least the partial restoration of the purchasing power of the people, and that can only be brought about by their full employment. A significant fact in this connection is the expansion in the production of pig iron, which is now proceeding at a rate approximating 9,000,000 tons per annum, or but little below the maximum output thus far attained. This being the basis of the iron industry, which is accepted universally as the barometer of general trade, the era of depression may be regarded as on the wane.

Politeness.

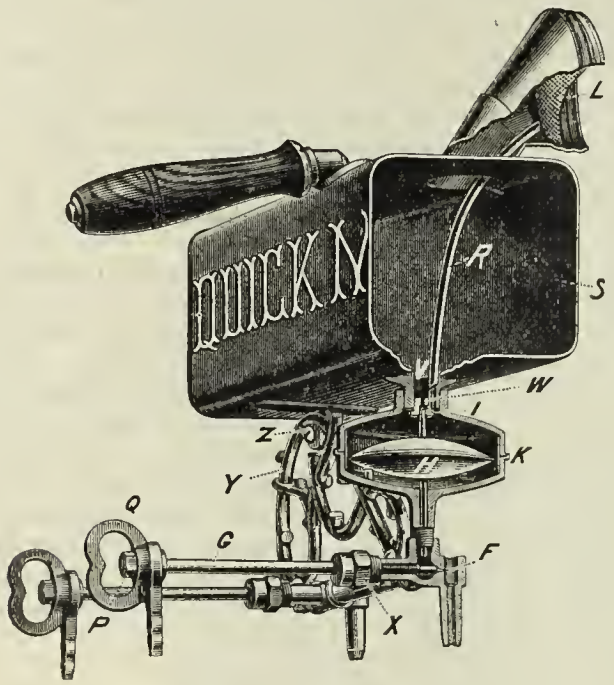
Politeness would appear to be one of the graces frequently considered unnecessary in the management of the shop. How often does the spirit of true politeness enter into the dealings of many foremen with their men whose work they direct? And because of the lack of it, how seldom do they receive from these men either the sympathetic or respectful obedience that is necessary to the most efficient management. Politeness should certainly not be confounded with familiarity or effeminatness, for it may go hand in hand with dignity of bearing and the most rigid enforcement of just orders. Its exemplification will always secure the respect of those who come under its influence, and it cannot fail to raise the moral tone of the shop and to create harmony between employer and employed. Because the man in authority has the legal (but by no means the moral) right to speak impolitely and even abusively to his workmen, who in turn are ordinarily expected to hold their peace, there certainly rests uponthe ruler the responsibility for any such condition as may result from ill-chosen words addressed to a workman. The golden rule is the rule of true politeness, and one may well hesitate if he thinks how his intended remark would sound if addressed to himself. How often the feelings of a conscientious workman are deeply hurt and his ambition chilled by the cutting, fault finding remark of his superior. A man with a conscience feels badly enough when he makes a mistake without being rudely treated because of it. It takes but a word politely spoken by his foreman to make him appreciate far more deeply his error than he would if he were angered by unjust criticism. A man has no excuse for impoliteness. He can acquire a manner that shall be more than merely just—a manner that shall express his desire to treat others as he would have them treat him, and he may rest assured that this acquisition will certainly raise him in the estimation of all with whom he is concerned.

Ventilation.

There are many readers who will peruse with interest the contribution by George D. Hoffman of Chicago, Ill., printed in another column, which deals with the all important subject of ventilation, a subject that is given too little attention in practice. In this country particularly, the healthfulness of fresh air is not snfficiently emphasized, but the recognition of its importance is happily growing, and all information relating to the methods of ventilating and the problems connected with it is sought by an increasing number. In Mr. Hoffman's article practical rules are given for figuring the velocity of air in ventilating flues, and those who do not care to work out the problem for themselves will be assisted by the table presented. What is said about the friction of air in passing through flues and openings is worthy of attention, as it is a matter too frequently disregarded. Altogether the article will well repay the attention of those who really care for fnndamental information.

Elsewhere we print the substance of an invitation issued by a number of progressive manufacturers of Cincinnati to attend a meeting in that city

on the 22d of this month, for the purpose of forming a national association of manufacturers. Such an organization, if well conducted, must prove a splendid engine for the advancement of our producing interests. We need the efforts of an influential body to effect reforms and aid in the pioneer work of establishing American goods in the markets of the world.



Test of Fire Proof Material.

An interesting test of a recently discovered process for rendering wood work and textile fabrics practically fire proof was given in New York City on Saturday, January 5, before a number of officials of the Fire Department, the New York Board of Underwriters and several representatives of important rail road and steamship companies and other large interests. On a large vacant lot at Fifty-eighth street and Broadway a small frame house was put up which was used for the experiment. The house was filled with pine shavings and kerosene oil, and the greater part of the wood in the structure was covered with the preparation patented by the Electric Fireproofing Company of New York City, who control the new process. Curtains which were hung at the windows had also been treated with the preparation. A fire was started in the building, which burned fiercely for an hour Only those parts which had purposely been left unprotected by the fire proofing preparation were apparently affected so far as combustion is concerned. The curtains also hung in their places until the whole structure collapsed from disintegration. The experts present are reported to have expressed the opinion that this was one of the most severe and successful tests that had ever been given to any fire proofing process.

"Tectorium" is the name of a substitute for window glass which has for some time been used in Austria, Italy, Germany, Switzerland and Russia as a covering for hothouses, verandas, windows of factories, roofs of stores, &c. It is described as an insoluble bichromated gelatine, translucent as opal glass, and incorporated in wire gauze.

The Quick Meal Tank for 1895.

The Quick Meal Stove Company of St. Louis, Mo., have been seeking for several years to produce a tank with a detachable and cleansible float for use in connection with their vapor stoves, but it was not until recently that they succeeded in accomplishing the objects sought. The new tank which they are offering the trade possesses features of novelty which cannot fail to prove of interest to all handling stoves using gasoline as a fuel. The makers state that the construction is such that the tank will not vary one drop a minute, whether it be full or nearly empty. Reference is made to the ease with which it can be dismantled and all the parts cleaned. Referring to the accompanying illustration, which represents a section through the tank, H is the float and K its housing, both of which can be easily removed by taking out the bolts Z and unscrewing the joints. After this has been done the plug W can be removed, leaving an opening, V, into the main tank, which is said to be sufficiently large to freely permit the escape from the tank of any sediment it may contain. The parts can be replaced without trouble, there being no packing employed and all the joints are metallic. The heads on the tanks are not only soldered, but are double seamed on a special machine made for the purpose. The drip valves are provided with stuffing boxes, which the makers state will prevent leakage in case the valves become worn from long use.

Quick Meal Tank for 1895.

The industrial classes of Rochdale, England, are about to celebrate the jubilee of the co-operation movement inaugurated in that busy and thrifty town. This celebration, says the *Labor Tribune*, is to be of a practical and sensible nature, as behooves so eminently sensible a movement. This movement, begun without pretension or parade, for 50 years has dispensed with fuss and feathers, and proposes to make the capstone of its jubilee a donation of $5000 to the Rochdale Infirmary. The organization was formed in December, 1844, with 28 members, and a capital of $140. The stock for their modest store in Toad lane was carried in a wheelbarrow. From this parent root no less than 1700 co-operative societies have come into existence, with 1,300,000 members, an aggregate capital of $90,000,000, the annual turnover being about $250,000,000, and the profits about $25,000,000 a year.

A National Convention of Manufacturers.

W. A. Procter, president of the Proctor & Gamble Company; Thomas P. Egan, president of the J. A. Fay & Egan Company; Edward C. Hall, president of the Herring-Hall-Marvin Company; Charles Davis, president of the Lodge & Davis Machine Tool Company; Robert Laidlaw, president of the Laidlaw Dunn-Gordon Company; Jas. E. Mooney, president of the American Oakheather Company, and H. M Lane, president of the Lane & Bodley Company, constituting a committee of the manufacturers of Cincinnati and Hamilton County, have issued a call for a convention of manufacturers to be held in Cincinnati on January 22, 1895, for the purpose of general interchange of views looking to the formation of a National Association of Manufacturers, which shall embrace among its purposes:

1. The cementing of a national organization of the manufacturers of the United States, for the purpose of considering national questions affecting their interests.
2. The advocacy of carefully considered legislation, to encourage manufacturing industries of all classes throughout the country.
3. The discussion of ways and means, whereby trade relations between the United States and foreign countries may be developed and extended.
4. The establishment in South American capitals and other desirable points of expositions for the display of American products.
5. The extension of the commercial marine of the United States.
6. The recognition of the Nicaragua Canal and the control of the same by the United States Government.
7. The re-establishment of reciprocal trade relations with foreign countries.
8. Such other topics as may be agreed upon by the convention.

It is desired that this convention shall be non-political, non-partisan and non-sectional.

The invitation is without limit as to number of attendants, and is extended not only to accredited delegates from organized exchanges, representing manufacturing interests, but to any individual manufacturer who may have the promotion of the general good by organized effort at heart.

The following programme has been outlined:

Tuesday, January 22, 1895, 11.30 a.m., preliminary meeting at Odd Fellows' Temple; temporary organization, appointment of committees.

Wednesday, January 23, 1895, 10.30 a.m., meeting at Odd Fellows' Temple; hearing and discussion of reports of committees. Two p.m , reception and lunch at the Queen City Club; evening, 8 p.m., concert and entertainment by the Symphony Club of the Chamber of Commerce.

Thursday, January 24, 1895, 10.30 a.m., meeting at Odd Fellows' Temple; permanent organization, selection of headquarters, election of officers. Evening, citizens' reception and banquet to visiting delegates.

The secretary of the Committee of Arrangements is E. P. Wilson, Room A, Chamber of Commerce, Cincinnati, Ohio.

PLUMBING and GAS FITTING.

Master Plumbers of New York.

Owing to the regular meeting night of the Master Plumbers' Association of New York falling on a holiday, it was postponed until January 8, when a special meeting was called. At this meeting the annual election was held, and the following officers were selected for the ensuing year :

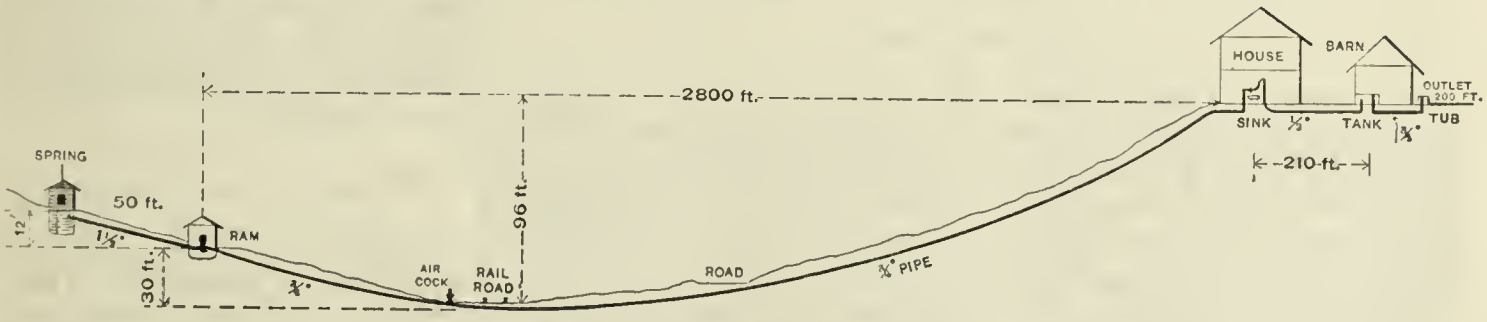
President, Henry G. Gabay, 892 Third avenue.

Vice-President, Henry J. Pattison, 258 West Eighteenth street.

Corresponding and Recording Secretary, Charles A. Schloesser, 359 East Sixty-eighth street.

Financial Secretary, I. J. Brown, 166 East Eighty-second street.

Treasurer, John Yule, 68 West Ninety-fifth street.



Marshall, J. G. Collins, 358 East 116th street.

Sergeant-at-Arms, Chas. J. Walsh, 10 Forsyth street.

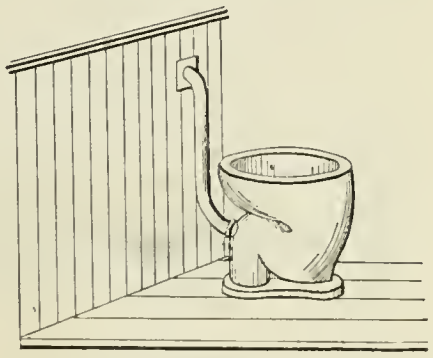
Board of Trustees: James Gillroy (Chairman), 592 Park avenue; Wm. Montgomery, 258 West Eighteenth street; John Mitchell, 113 Hudson street ; Alexander Bryant, 12 East Twenty third street, and T. J. Tuomey, 1248 Third avenue.

A Suburban Water Supply.

The system of water supply shown in the accompanying illustration was put in operation by A. S. Brown of Norfolk, Conn., for one of his customers, the work being under the supervision of W. E. Case. The system has now been in operation for some time and is said to work perfectly. The water supply is taken from a spring which is located nearly 3000 feet from the house. The spring has been walled up so that it is 7 x 9 feet inside measurement, and has a depth of water of 6½ feet. A No. 4 W. & B. Douglas ram is located 50 feet from the spring, at a point having about 12 feet fall. A 1¼-inch supply pipe is run from the spring to the ram. A ¾-inch pipe runs from the ram to the house, having a fall of 30 feet to a point where it begins to rise, and making a rise of 96½ feet from this point to the house. A cock is placed at the low point so that the system may be drained. After entering the house the ¾-inch pipe rises to a faucet placed over the sink. After leaving the faucet the pipe is reduced to ½ inch in size and rises 3 feet above the sink, when it makes a downward turn and runs to a tank in the barn. This tank is arranged with a ¾ inch pipe as an overflow to a tub 33 feet distant in the barnyard. An overflow from the tub in the yard runs 200 feet and wastes. As the water is running through the pipe all the time there is very little danger of freezing; however, to prevent such a possibility the pipe from the spring to the ram is 4½ feet below the surface of the ground and from the ram to the house is 3½ feet below the surface. It is not wrapped or in any other way protected from the frost.

A Suburban Water Supply.

Lead Burning Class.



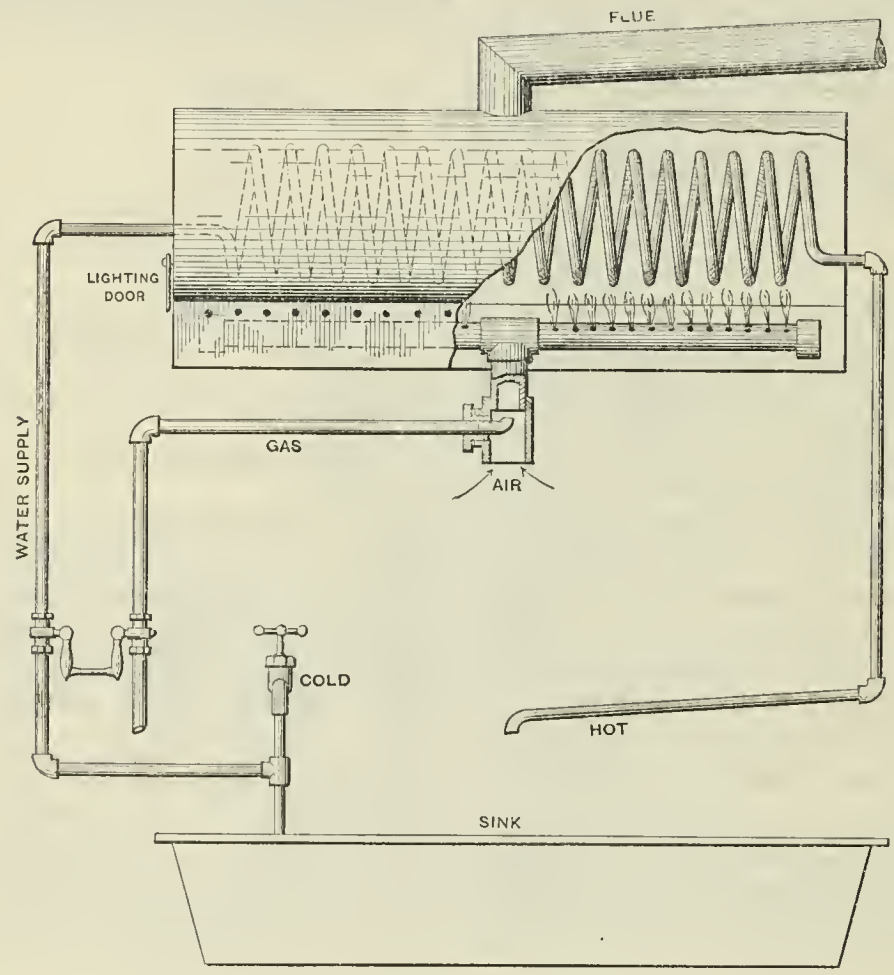
The day class in plumbing at the New York Trade School has been in operation one month under the superintendence of John Delehanty with the assistance of John McMenamy, Rutherford Clark, T. B. Walmsley, J. Wood and Thomas Kelly, and the boys are making rapid progress in the work. On next Tuesday the class in lead burning opens under the superintendence of T. B. Walmsley. Owing to the superior proficiency gained by the class last year under the instruction of Mr. Walmsley, the class this year opens with a surprising number of applications, 52 scholars having placed their names on the list, and others are unable to secure this course, not having filed their applications in time. That all these young men would not have frequent occasion to use lead burning as applied in the past is more than probable, but as a part of Mr. Walmsley's instruction he shows them how a plumber can use lead burning with advantage almost daily. The simplicity of his methods and apparatus have made many good lead burners much to the surprise of those who have been acquainted with lead burning as it is generally practiced.

In the past there has been some effort to create and maintain the idea that lead burning was a mysterious art, which only those who were especially gifted could acquire. To discover that there is a delusion needs only a visit to the school when the class are at work.

THE BEATON & BRADLEY COMPANY, Southington, Conn., are running their shop, making ceiling plates for the pipes run by plumbers and heating men in their work.

An Unventilated Vent.

From PLUMBER, *Chicago, Ill.*—According to the rules and regulations of the Department of Health, "all traps must be protected from siphonage by special vent pipes." The vent pipe is to connect with the increaser just below the roof, and is a very proper provision. Under some circumstances it is very inconvenient, or expensive, for the plumber to place a vent pipe so it will



An Unventilated Vent.

connect the water closet with the increaser. A case of this kind recently came to the knowledge of an inspector, and certainly shows the importance attached to the inspection of plumbing work. As shown in the accompanying sketch, the vent pipe started from the water closet in an orderly and proper manner. It continued to the wainscoted partition, at which point a square piece of sheet lead was tacked and a wiped joint made connecting the lead and pipe. It was supposed, of course, that the vent pipe extended into the partition and thence through the roof. For some reason the piece of sheet lead had sprung away from the wainscoting so a knife blade could be inserted between, and what was the inspector's surprise when he discovered there was no pipe, as the vent was only "bumped" against the sheet lead and a joint made, leading one to suppose that the vent extended upward to the outer air. The boss was greatly surprised when this condition of affairs was made known to him and disclaimed all knowledge of the affair. As a result it is presumed the journeyman plumber who did the work in such an improper manner received all of the blame. It is perhaps unnecessary to state that the vent pipe was extended

to the pure air that is supposed to surround Chicago dwellings and that the plumber was put to considerable expense and trouble in making the change.

A Gas Water Heater.

From L. M. W., *Delaware* —Some of your readers may be interested in the water heater which we are using in our shop. Being located near a junk dealer I noticed a copper coil about 6 inches in diameter and 20 inches long lying on a pile of iron all one summer and coveted it, though I had no use for it. When the winter set in we found washing our hands in cold water rather chilly, but with the chill came the junk dealer for a man to fix his stove grate. I told him I would do it myself if he would give me that old coil, to which he agreed. I heated the coil and bent it so that the ends pointed at a right angles to it, as shown in the picture. I then made a jacket of No. 24 galvanized iron 8 inches in diameter and 21 inches long, and cut a slot in it 2 inches wide and 19 inches long, and riveted to the slot an open top chamber 2 inches wide and 2 inches deep. Next I made a burner out of two pieces of 1-inch pipe, drilling ⅛-inch holes in them along on both sides ¼ inch apart and about one-quarter of the diameter apart the other way. The pieces of pipe were about 7 inches long with a cap on the end, and they screw into a T and set in the burner chamber. I fixed a baffle plate in the jacket, set the burner in place, and then fastened the coil in the jacket, after which I put a head in each end. One head has a hole in it for lighting the burner, and I punched a row of ⅛-inch holes along the slot 1 inch apart to give air to the burner. A 2-inch pipe with a damper in it leads from the jacket to the chimney. Straps riveted to the jacket hold the coil and burner in place. Into the T in the burner I put a nipple, then another T, open at the bottom to admit air, the gas entering the side of the T through a small tube that pointed up a little. I fastened the heater against the wall of the shop over the sink, and took a branch out of the cold water pipe just below the faucet, and ran it to the coil, putting a stop cock on it, and ran a pipe from the other end of the coil to a convenient place over the sink. I piped the gas supply to the burner with a stop cock on it near enough to the water cock to connect the levers. In operating either cock, both are opened or both are closed, and the gas flame is extinguished when the hot water is shut off. By this arrangement no faucet is needed on the hot water supply at the sink. Before this apparatus was constructed we had no means of getting hot water in the shop, which was heated by a hot air furnace, and there was too much difficulty and expense in putting in a pipe coil attached to a boiler. One day the boss had been out with me and we both got our hands as dirty as moist soot could make them, and in the office he expressed a wish for hot water for washing up. As he knew nothing of my water heater I surprised him by saying I could furnish him with all the hot water he wanted in a minute at the shop sink. I invited him to the shop and opened the lighting door in the heater and struck a match, opened the stop cocks, lit the burner and in less than a minute he had water in abundance as hot as he wanted it. He gave me an order to make one for the office, which I placed under the basin and fitted it with a small pilot light. They both do good work, did not cost very much and use very little gas.

A Gas Water Heater.

THE WELLS NEWTON-QUAY COMPANY, Chicago, have moved their office from the first floor to Rooms 237–238 Monadnock Block.

Maelstrom Siphon Closet.

The Maelstrom is the name of a new siphon closet which Owen & Salter, Buttonwood and Twelfth streets, Philadelphia, are putting on the market. The accompanying cut shows the closet complete with seat and cover. The action of the closet is claimed to be strong and rapid and absolutely noiseless. These features are due to the arrangement of the water supply, which is divided at its entrance by means of arms on each side of the closet and carried to the flushing point, where the streams are again united. Another feature is the mode of securing the seat. As will be seen the fastening is effected by a clamp of pleasing design, which fits in a groove around the supply arm. This does away with the ordinary screw fastening, and insures a strong and perfect attachment which cannot become loose. The closet is claimed to work perfectly under any pressure, and, by reason of its manner of operation, to be free from odor. It is made of vitrified china, which will not craze, and in its construction the makers have aimed to secure durability.

Maelstrom Siphon Closet.

Patronize the Plumber.

A commercial traveler writes in a local paper: I would like to call your attention to the statement that it is of "almost monthly occurrence that some 'Reuben' from the country blows out the gas while retiring for the night at the hotel where he may be stopping." I have been on the road for nearly 20 years and have found that a great many of the gas fixtures in the hotel rooms are sadly out of repair. It is quite often the case that when the stop or key is turned to shut off the gas it does not stop where it should, but turns around too far, thereby putting out the light, and at the same time letting on the gas again. I have found a great many fixtures out of fix as described above. It has often occurred to me that possibly some of the deaths charged to the verdancy of the lodger might well be laid to the carelessness of the landlord.

Philadelphia Master Plumbers' Association.

The annual meeting of the Philadelphia Master Plumbers' Association was held at the Builders' Exchange, Philadelphia, on Thursday evening last. After routine business was disposed of the election of officers for the ensuing year took place, the following being elected:

President, John E. Eyanson; vice-presidents, Geo. F. Uber, Frank P. Brown, John Gormly, Wm. McCoach and G. Wallace Smith; recording and corresponding seecretary, William S. Clark; treasurer, William Harkness, Jr.; directors, William S. Clark, Chas. L. Parmalee, Wm. Harkness, Jr., A. M. Hicks, R. Drummond, J. Sellers Pennock and John E. Eyanson, *ex officio;* sergeant at-arms, Samuel B. Fleming.

The committee on the National Convention reported favorable progress of arrangements.

Some little discussion took place in regard to the proposed city ordinance regarding the opening of streets, under which the charges for permits varied according to the kind of pavement opened. There had been a meeting that day of the sub committee of Councils' Committee on Highways appointed to consider the matter. Mr. Harkness, as the representative of the master plumbers, reported the result of his attendance before the committee. The president of the Operative Builders' Association had also attended the meeting and had stated that his association desired to have a fixed price for repaving ditches. Mr. Harkness indorsed the opinion of the operative builders. The city, he said, should take charge and there should be a fixed price for each opening. He had urged that a postponement of action be allowed in order that the matter might be discussed intelligently by the master plumbers. It had finally been arranged that a meeting between the plumbers and operative builders should be held on the 17th inst., and their representa tives appear again before the sub-committee of councils on the following day, when some definite course of action would be agreed upon. A committee was accordingly appointed to attend the meeting next Thursday.

Mr. Harkness informed the meeting that an exhibit of the plumbing work executed by the boys in the Trade School of the Builders' Exchange would be placed in the permanent exhibition attached to the exchange.

The Plumbing class in the Trade School is filled to the overflowing point, and the showing so far is very satisfactory.

TRAPS AND VENTS.

Mayor Schieren of Brooklyn, N. Y., has appointed P. H. Gleason of 185 Fort Greene place on the Examining Board of P umbers. The compensation is $5 a meeting, for four meetings a month.

The Day, Ward Company have moved into their new building on North Park avenue, Warren, Ohio. It is a substantial two story and basement structure of hollow tile blocks, and is a model establishment, heated throughout with hot water. Power is furnished by a 12 horse-power gasoline engine, and it will be lighted by an independent electric service.

Pritchard & Co., plumbers, have removed from Exchange street to Pickering square, Bangor, Maine.

The Swain Bathtub Works, 1707 Carpenter street, Philadelphia, have a capacity for turning out from 60 to 80 bathtubs per day and report that their business in copper, zinc and galvanized iron lined baths is on the increase.

E. Comport & Co., 921 Filbert street, Philadelphia, carry an extensive line of fine sanitary goods, in baths, closets and lavatories, in addition to their line of plumbers' brass goods and steam fitters' supplies.

Dr Z. Taylor Emery, health commissioner of Brooklyn, N. Y., has appointed Wm. Paul Gerhard, C.E., to the position of honorary consulting sanitary engineer to the Department of Health of the City of Brooklyn.

Erion & Dome are a new plumbing firm at York, Pa.

The advisability of having a plumbing inspector is being discussed at Charlottesville, Va., where a new system of sewers is to be opened.

The new licenses to plumbers and drain layers in Milwaukee, Wis., were issued last week by the Board of Public Works. There are 103 plumbers' licenses and 131 drain layers' licenses. Both plumbers and contractors lay drains.

S. Davis n, 56 Beekman street, New York, is issuing a 16-page catalogue of Weeden's hotel and public building sanitary specialties. The first pages of the book are devoted to a waste preventing urinal, the use of which starts the flush. Three illustrations are shown of it. Next, a slop hopper, working on the same principle, is shown. A scientific safety basin occupies the next pages, a sectional view showing how the water is siphoned out of the basin before it can overflow. The last specialty is a chair closet adapted for use in apartments where the appearance of an ordinary closet would be objectionable.

Carl Jenner, formerly with J. B. Farnsworth, Leominster, Mass., will open a plumbing establishment on his own account.

On January 10 the Master Plumbers' Association of Brooklyn, N. Y., installed the officers elected to serve during 1895. They are: President, E. A. Macdonald; vice-president, H. L. Potter; recording secretary, H. M. Noble; financial secretery, John W. Kelly; treasurer, Geo. B. Lewis; marshal, J. J. Keenan; sergeant-at-arms, Joseph Zoll; trustees, Wm. C. O'Keefe, Thomas H. Radcliffe and Martin Fallon. Conference Committee, Wm. J. Gault, H. Anderson, Thomas H. Radcliffe, J. Manneschmidt, M. F. Gleason and Martin Fallon. The ceremonies were in private and at some later date a public entertainment will be given.

John P. Ganley has been appointed Plumbing Inspector and Wm. H. Hudson has been appointed a member of the Examining Board of Plumbers at Hudson, N. Y.

P. E. Cox, Fort Wayne, Ind , has established a branch of his plumbing business at Columbia City, Ind.

The plumber will find artic'es both for himself and his customer at Lalance & Grosjean Mfg. Company, 19 Cliff street, New York. They have an extensive line of ladles for pouring molten lead, those of smaller size for wiping joints on small pipe, increasing in size to large ladles for pouring lead in the joints on extra large soil pipe. They also have a large line of stamped steel sinks for bath, kitchen and pantry use, some being finished as polished steel and others finished in enamel in different colors.

The Folding Bathtub Company, Marshall, Mich., have increased the size of their plant by one-third, and added several new and improved machines for special work. The demand for their specialties was sufficient to keep their plant in full operation the whole of last year.

The plumbers of the different cities in Connecticut are co operating in an effort to have a law passed at the next session of the Legislature to properly regulate plumbing and drainage in the State. The law will provide for an examination of plumbers and an inspection of plumbing work.

E. M. Brown has withdrawn from the Clement & Brown Mfg. Company, Bangor, Maine, and in the future O. L. and F. G. Clement, under the same firm name at the old establishment, 133 Exchange street, will continue the business of manufacturing furnaces, stoves, &c., plumbing, steam fitting, tin and sheet iron work. The Mascot furnace has been a specialty of the concern.

On January 1 the firm of P. McAuliffe & Son hung their sign to the public, at Augusta., Ga. This is the well known house of P. McAuliffe, plumber and gas fitter, with the addition to the firm of Theo. G. McAuliffe, who has been admitted as a partner. The firm will continue in business at 838 Reynolds street.

The officers for 1895 of the Master Plumbers' Association of Paterson, N. J., are: President, James Kearney; vice-president, John Quinn; corresponding secretary, James T. McNab; financial secretary, William McKeon; treasurer, Edward Blair.

James S. Lindley has sold his plumbing business, stock and tools to E. J. Winslow & Co., at Brattleboro, Vt.

The Master Plumbers' Associa tion of Cincinnati, Ohio, held its an nual election at the Builders' Exchang last week. Nearly all of the members who number about 60, were present The election resulted as follows: Presi dent, E J. Nolan; vice president, Charles Atkinson; secretary, Frank Hopper; treasurer, James A. Gibson; sergeant-at-arms, Thomas Lynn.

Plumbing Inspector Wayson of Detroit, Mich., was very busy last week inspecting the plumbing in a number of new and large buildings in that city.

In the issue of the Boston *Herald* for Monday, January 7, were sketches of a number of firms of that city which had been in active business for 50 years or more. Among the number were the Dalton Ingersoll Company, manufacturers of fine sanitary appliances. We quote from the article as follows: "This house was established in 1845 by Dalton & Ingersoll, who conducted the business for years at 17 and 19 Union street, removing thence to their present commodious quarters of a five story building, 56 x 180 feet, at 169 to 175 High street, Fort Hill square. About two years ago the business was incorporated with a paid up capital of $125,000, under the present style, thus perpetuating the names of the founders. The officers are Emery F. Souther, president, Charles W. Morse, treasurer, and William Scott, manager. These gentlemen are all natives of Massachussetts and devote their personal attention to the management of the enterprise. No house is more fully equipped for the proper transaction of its business, none more progressive and alert."

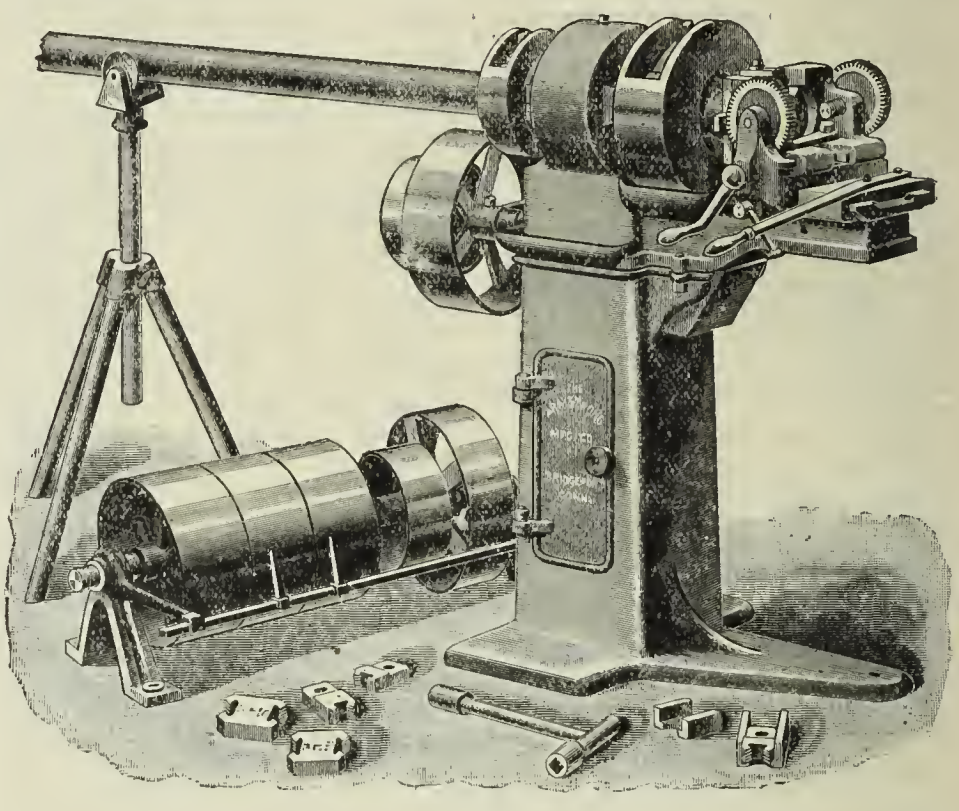
STEAM AND HOT WATER.

Steam and Hot Water Heating at the New York Trade School.

The three months' day class of instruction in steam and hot water heating was opened at the New York Trade School on January 2. This class began with a greater number of applications than was ever secured on the first opening of any of the classes in the different trades taught at the school. The lectures will be given by Thomas E. McNeill of Thomas E. McNeill & Son, heating and consulting engineers, 125 West Thirty-fifth street, New York. The manual instruction will be given by Charles Coolidge. Mr. Coolidge is well qualified for the position, having spent ten years with the Nason Mfg. Company in their pipe fitting department, and for the last four years as superintendent of the installation of such work as had been contracted for by William J. Baldwin, the well-known engineer.

Although the class has only been started a few days, some idea of its value may be gained from the remark of one of the pupils. The young man has worked at plumbing and gas fitting for four years and said: "I have already learned quite a good many valuable things about measuring for pipes, laying out work and putting up the pipe, that would have saved me much trouble had I known them in the past." The class is composed of:

Albert J. Logan, Brooklyn, N. Y.
Alfred D. Conant, Plainfield, N. J.
Arthur R. Thorpe, New Haven, Conn.
Arthur S Ingersoll, Beverly, Mass.
Charles E. Scudder, Binghamton, N Y.
Gavin N. Houston, East Orange, N J.
George H. Brown, Chicago, Ill.
Herbert L. Moore, Cambridge, Mass.
J. Harvey Ward, East Orange, N. J.
Jacob J. Keller, New York City.
John A. Hempel, New York City.
Paul Mueller, Milwaukee, Wis.
Rudolph Ewald, Jersey City, N. J.
William H. Kroephe, New York City.



Armstrong Pipe Threading and Cutting Off Machine No. 2½.

The illustration presented herewith shows an improved form of the No. 2 pipe threading and cutting off machine for hand or power, built by the Armstrong Mfg. Company, Bridgeport, Conn., and retains the many attractive features of that machine in addition to others peculiarly its own. It is described as very compact, rigid and durable, and does not require the services of a skilled operator. All of the gears and working parts are inclosed in an oil tight chamber, which insures their perfect lubrication and effectually keeps out dust, dirt and chips.

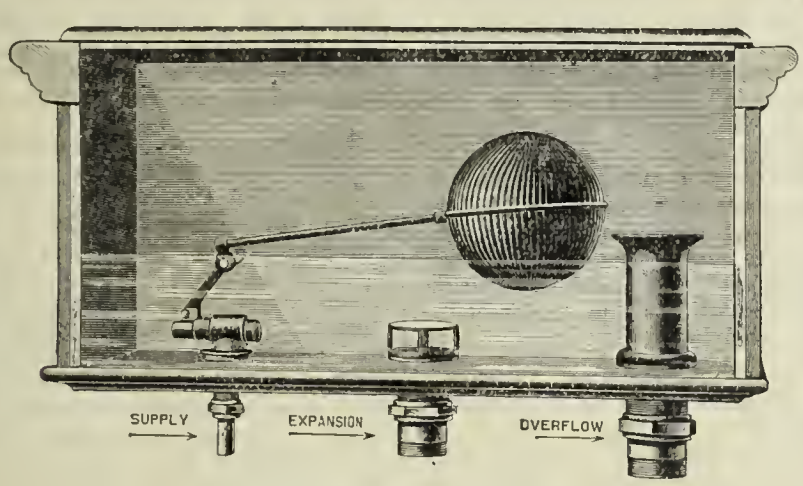
Ease of operation and long life to the vital parts of the machine naturally follow, it is pointed out, as the result of this construction. A peculiar feature of the machine is that in its operation the pipe revolves instead of the dies, being held securely by tight gripping chucks.

For radiator steam coil works, &c., and other services where the greater number of pipes are comparatively short lengths, this is referred to as a particularly desirable arrangement. The dies and cutting off tool are held stationary, and are opened and closed by means of a double geared crank handle, as shown. Expanding dies are used in connection with a self centering and powerful gripping chuck, insuring speed in cutting off and threading a pipe. These are of the regular Armstrong pattern, and are furnished to thread from 1 inch to 4 inches inclusive. Quick interchangeability of the various sizes of dies, coupled with a construction which permits of separate adjustment for three different sizes, enables the operator to thread pipe to suit all variations in ordinary fittings, and to open and close the dies any number of times without changing the adjustment. Again, either of the sizes may be used alternately without change of adjustment, or the dies may be quickly taken out, to permit of the free passage of the pipe to be cut off, and the adjustment still remain unchanged.

An objection frequently raised against machines using expanding dies is that the men are not skillful enough to use expanding dies without threading some of the pipe too large and some of it too small. This has been met, and, it is claimed, successfully overcome in the tool here shown; for although the dies are quickly opened after threading a piece of pipe, yet they may be as quickly closed together again without the least danger of variation, unless intentional. The weight of this machine is about 700 pounds; with countershaft, 850 pounds. Speed of countershaft should be about 225 revolutions a minute. The Armstrong Mfg. Company report a wide adoption of the No. 2½ machine among water, gas and steam fitters generally. The headquarters of the company are located at Bridgeport, Conn., with New York offices and salesrooms at 139 Centre street.

Armstrong Pipe Threading and Cutting Off Machine No. 2½.

Circuit System of Hot Water Heating.



From S. B., *Dalton, Mass.*—We have read with interest the account of piping a combination hot air and hot water furnace given by the Howard Furnace Company in *The Metal Worker* of October 20. We wish to inquire if such a system could be used satisfactorily in piping a common hot water boiler? If such a system can be used, would it work as well as with separate flow and return mains?

Note.—We shall be glad to have any of our hot water heating friends who have had experience with the circuit system express their views in answer to this correspondent. In order that he may have some information as a guide, we would say that a number of house heating boilers have been piped on tha

circuit system with satisfactory results. It is probable that more skill, or rather a more thorough understanding of the science of heating, would be necessary in installing a satisfactorily working circuit system than would be required with a separate flow and return to each radiator. The article which appeared on October 20 calls attention to the fact that the radiators increase in size the further they are placed from the boiler, to offset the cooling of the water.

Automatic Expansion Tank.

We show in the accompanying illustration an automatic expansion tank brought out by the Ideal Boiler Company, 35 Dearborn street, Chicago, and 45 Oliver street, Boston. The tank is designed to be located in the bathroom or any other situation over the highest radiator and convenient to the water and plumbing system of the house. It is made of hard wood, dovetailed at the corners and lined with sheet copper, and can be supplied in any kind of wood to match the finish of the room. It is pointed out that the necessity for gauge glass and fittings, as well as the altitude gauge, is avoided. It is said

Automatic Expansion Tank.

to be absolutely automatic in its operation. The size illustrated is adapted to hot water work to which there is attached 2000 feet of radiation or less.

A Heating Problem.

From Hub *Boston, Mass.*—In reading *The Metal Worker* of December 29 I noted the letter from "T. F. C.," asking for a solution of the trouble which he describes and illustrates with a diagram. I think the trouble is caused by the return water from the 60 foot radiator throttling that from the two radiators of 100 feet of surface. As he does not state the distance from the boiler to these two radiators, I take it for granted that it does not exceed 35 lineal feet if they are on the first floor, or 50 feet if on the second. It may be well to state that by throttling I mean that the return water from the 60-foot radiator being very much hotter than that from the two radiators, and the pipe being pitched up toward the two radiators, the hot water has a tendency to move toward them instead of back to the boiler. If the cause is what it appears to be it can be remedied in several ways: 1. The safest and cheapest way is to bring a separate return back to the boiler from the 60-foot radiator and enter it at the base of heater or bottom of return. 2 Make the return from the 60 foot radiator enter the main through a Y fitting and from the side instead of the top of the main. 3. Do not have the pitch of main from the radiator connection exceed 1 inch in 10 feet. This will probably prevent throttling. 4. Take expansion pipe from end of main that does not circulate. If throttling is the trouble, some one of these remedies will cure it, if there is not a pocket in the main; if there is it must be taken out.

Why we Ventilate.

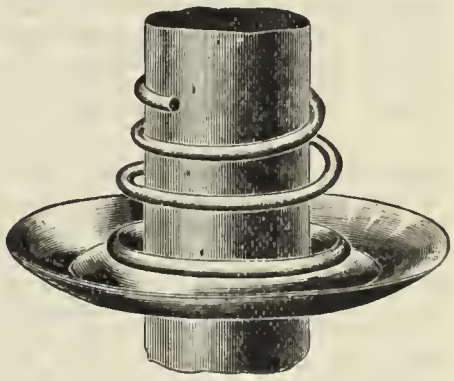
A paper, from which we quote below, read by Louis Wilde before the Society of Minnesota Florists, discusses pure air and ventilation as necessities in a manner that presents the arguments from a new and impressive standpoint.

In experimenting with our roses under glass, I think that we go at it entirely too one sided. We pay too much attention to what our plants must have to eat and drink, so to speak, and too little or none at all to what they must breathe. In other words, we care too little about the air our roses have to live and grow in. As long as it does not appear foul to our sense of smell, and is not considered bad from our personal point of view, we are apt to regard it as all right for the roses, forgetting that what is agreeable to us may not be to them, and *vice versa*.

I have been through quite a number of rose houses, and what I have seen and the opinions I have heard expressed regarding ventilation are astonishing. One meets so called rose growers who have not the faintest idea why rose houses should be ventilated, neither do they know or suspect what influence the air exerts on the growth of the plants. Many consider ventilation an easy means of regulating the temperature of the houses rather than anything else, and, with them, opening the ventilators in cold weather means a needless waste of coal. There are growers who keep their houses shut tightly for two or three months at a time during cold weather.

In my opinion there are two good strong reasons why we should ventilate:

1. To change the exhausted air of the houses for the purer one without, full of the elements necessary for plant life.



2. To regulate the moisture contained in the air in our houses.

We all know that one of the most important substances which build up the tissues of the plant is taken directly from the air through the pores of the leaves and under the influence of light. I am referring to carbon. The air contains relatively only a very limited quantity of this element and important plant food. In such a comparatively small space as our houses this will soon be used up. When carbon is not present in the air of our houses in sufficient quantity the plants will not grow vigorously. Its total absence means death to them. This, however, will rarely, if ever, occur, as no house can be built air tight, and on that account an exchange of air, however insufficient, will always take place. On the other hand, a small amount of carbon is also supplied by all decaying vegetable matter in the houses, such as sods and stable manures, so that even if a house be never ventilated the plants will not die at once, but as the supply of carbon is insufficient they will grow straggling and sickly. As plants are taking up carbon during daylight, we should have ventilation during that time, if at all possible.

We must further ventilate, as before stated, in order to regulate the atmospheric moisture of our houses. Moisture of the air influences indirectly the growing process of the plants in so far as its presence in smaller or larger quantity regulates the evaporation going on on the surface of the leaves, which evaporation in its turn gives rise to the flowing of the sap, thereby causing nutrition of the plants.

The Columbia Ceiling Plate.

The J. W. Chamberlain Company, Bangor, Me., have recently patented and are manufacturing the Columbia patent wall and ceiling plate, a view of which is shown in the annexed illustration. The device is so simply made that a brief description will suffice, and the advantages of its construction will be readily understood by referring to the engraving. The plate is designed to be used on all steam and hot water

Columbia Ceiling Plate.

pipe and is complete in itself, requiring neither screws, hooks nor other device to hold it in place. After it is put in position the spring is pulled taut and the work is completed. It will be understood that the expansion and contraction of the pipe will not affect the plate, which, it is said, cannot slip away from the ceiling, since it is held by the pressure of the spring, the spring giving with the expansion of the pipe and contracting as the latter contracts. The plate is made of stamped brass, nickel plated, and the spring of tempered steel, coppered. It is made in sizes ranging from ½, ¾, 1, 1¼, 1½ and 2 inches.

The steam and hot water heating trade will be interested in the new price lists of radiators just issued by the American Radiator Company, and which we print this week in the Trade Report. The regular and special lists are presented and reference made to a third list of the Favorite radiators, the entire output of which they handle.

HEATING NOTES.

THE IDEAL BOILER COMPANY of 36 Dearborn stree', Chicago, and 45 Oliver street, Boston, have sent out a quaint circular, which cannot fail to attract attention. It is a large maroon colored card, printed in silver, with a yellow circular of smaller size posted to one side of it. On the circular is the four-leaved clover of the company with the legend "A New Leaf for '95." On the inside pages of the circular are some very original remarks to buyers of boilers.

THE OLD STORE of the Cowles-Couch Company, Hartford, Ct., will hereafter be occupied by a new firm, Couch & Hartley, who will engage in the general plumbing and heating business. Mr. Hartley was formerly connected with the Howard Furnace Company.

THE STANDARD RADIATOR COMPANY'S general offices have been moved to their Chicago store, at 167–169 Lake street, and will be in charge of D. Paul Hughes, manager.

THE AMERICAN RADIATOR COMPANY of Chicago have arranged to open a branch office in London, England. Henry S. Downe, until recently one of the directors of the American Boiler Company of Chicago, will be in charge, having severed his connection with the latter company. Mr. Downe was born in Mason, N. H., and is 33 years old. Always accustomed to positions of responsibility, he was at one time superintendent of the Simonds Rolling Machine Company. He has been many years associated with the heating business in various capacities, and always with the leading companies engaged in the trade. He is a member of the American Society of Mechanical Engineers and is a graduate of the Worcester Polytechnic Institute. He was vice-president of the National Hot Water Heating Company when that company became a part of the American Boiler Company.

A NEW 20-ton cupola is in process of construction and nearly finished, at the United States Radiator Works, Dunkirk, N. Y. The cupola is the Whiting patent, very complete in all its workings, having a patent alarm when the metal rises, and other late equipments. It is 39 feet 6 inches high, with an incline hoist and scales. Another late improvement since the new foundry was built is the core drying ovens, in which 1750 cores can be dried at one baking. A bushel of coke dries 450 cores. These improvements were made under the supervision and from plans of Jesse A. Fields and Thomas M. Burman, the superintendent and foreman.

S. STEPHENS, secretary of the J. F. Pease Furnace Company, Syracuse, N. Y., was a visitor in New York City this week.

THE FOSTER ENGINEERING COMPANY of Newark, N. J., report a rapidly increasing demand for their new "Class W." steam pressure regulators. Among orders just booked for large valves they mention: One 10-inch, for the Lehigh Valley Railroad Company coal mines; three 8 inch, and one 5-inch, for the Watts-Campbell Company for use at the Newark Electric Light and Power station; one 6-inch, for the U Street Pumping Station, Washington, D. C; one 5-inch, for Dixon's Paper Mills, and two 6 inch and two 4-inch, for the new American liner "St Louis." These latter are in addition to 20 regulators from 8 inch to 4-inch, furnished for that ship in December.

A CATALOGUE AND PRICE LIST dated January, 1895, distributed by the Foster Engineering Company, Newark, N. J., is entitled "Facts Worth Knowing About Pressure Regulators and Pump Governors of Practical Value to All Steam Users." The publication is a neat pamphlet of some 40 pages, containing illustrations of the regulators, both general and sectional, together with full descriptions of the devices. Many different regulators are shown, together with some other steam specialties.

THE ADVERTISING MATTER distributed by Gaylord & Eitapence, Binghamton, N. Y., is both serviceable and attractive. A pamphlet entitled, "What Other People Have to Say About Gaylord & Eitapence's Imperial Boilers," is a publication of portfolio style, handsomely printed on fine paper, and shows cuts of the Imperial boiler, both brick set and of portable form; likewise, illustrations of the separate parts are given. The bulk of the work, however, is taken up with illustrations of buildings in various parts of the country heated by Imperial boilers, and in connection with the illustrations are given testimonial letters from the house owners. At the end of the pamphlet is a table of sizes and prices, capacities, &c. Another advertising specialty of more than ordinary serviceableness is a plaque of ivory tinted celluloid, carrying a neat engraving of the Imperial portable boiler ready for piping. At the side of the boiler is a thermometer, which is mounted on the sheet and marked with wide black lines that permit its easy reading. The red liquid in the tube is also plainer to the eye than the customary mercury thread. Altogether it is a most serviceable souvenir and will be much appreciated by those receiving it.

THE HERENDEEN MFG. COMPANY, whose Western office is at present at 131 Lake street, Chicago, with A. G. King as manager, are contemplating removal to larger quarters, where may be had a finer display of Furman steam and hot water boilers and heating supplies. The Chicago office of this company now handles the entire West outside of the coast and the State of Wisconsin, which is handled, as before, by E. A. Savage of Milwaukee.

THOMAS WEATHERED'S SONS are preparing to move their office to the Cornell building at 137–141 Centre street, New York, where they will display their line of hot water apparatus for heating residences and greenhouses.

T. J. DOUGLAS, representing the Richmond Stove Company, Norwich, Conn., passed through New York this week on the way West, where he will make an extended trip among the steam and hot water heating trade.

R D. JACKSON, 89 Centre street, New York, Eastern agent for the Van Auken Steam Specialty Company, Chicago, reports an increasing demand among the trade for the Van Auken air valve.

FRANKLIN & BURNHAM, the New York representatives of the J. F. Pease Furnace Company, Syracuse, N. Y., have moved their headquarters to the building at Beekman and Pearl streets. Here they have a well lighted showroom in which they will display the Economy line of furnaces, steam and hot water apparatus and combination heaters.

JAMES W. BIRKETT MFG. COMPANY have opened an office at 105 Beekman street, New York, where they are prepared to take orders for steam and hot water fitters' supplies.

THE EXECUTIVE COMMITTEE of the Master Steam and Hot Water Fitters' Association of the United States will meet at their headquarters in the Cable Building, New York, for the transaction of regular business at the same time that the American Society of Heating and Ventilating Engineers are in session during the fourth week in January.

AN EIGHT-SECTION 20-inch Niagara radiator connected with a small gas water heater is used as an auxiliary heater in the New York office, at 89 Centre street, of the Niagara Radiator Company, Buffalo, N. Y. This is a very attractive addition to the line of radiators that are on exhibition.

JOHN A. SCOLLAY, 74 Myrtle avenue, Brooklyn, has opened a very attractive office at 89 Centre street, N. Y. The floors are stained, with a handsome rug in the center, and the walls are frescoed in harmonious colors. Furniture of quartered oak adds to the surroundings. On a table the Scollay hot water thermometer is shown in its various styles in a nickel plated pipe stand, with literature pertaining to it and to the Scollay boilers for house heating and for greenhouse work. A platform is ready for the sample boilers that are being prepared to show the visitors from the steam and hot water heating trades.

THE STANDARD RADIATOR COMPANY of Buffalo, N. Y., have opened an office at 206 Centre street, which is under the management of John J. Leitch, formerly with Robert Leitch & Sons, Washington, D. C. The new headquarters fronts on Centre street and runs through to Baxter street, with a well lighted sample room and a large storage capacity. Samples of their varied line of radiators are being decorated for the showroom, and a carload of radiators for stock is being received. Mr. Leitch has just returned from a visit to Washington, where he has successfully brought the Standard radiators to the notice of the School Board.

J. J. WILSON called at the office of *The Metal Worker*, on his way to Troy, to visit the house he represents on the road, the Fuller & Warren Company. He reports some good sales recently in hot water apparatus and combination heaters.

Heating and Ventilating Engineers.

The Board of Managers of the American Society of Heating and Ventilating Engineers met on Thursday afternoon and completed the arrangements and programme for the annual meeting on January 22. The sessions will open at 10 o'clock on the morning of the 22d in the building of the American Society of Mechanical Engineers, at 12 West Thirty-second street, New York, and will continue three days. Members will receive next week copies of the programme, the features of which are the president's address, eight papers by members, selected topics for discussion and the election of officers. No special hotel arrangements have been made, as the place of meeting is in the midst of a hotel district of the city.

THE LETTER BOX.

Questions in Steam Heating.

From J. N. G., *Peoria, Ill.*—Please answer the following questions in *The Metal Worker:* What radiating surface will a 40 horse-power engine (plain slide valve) supply in 1-inch pipe, and what is an easy rule for figuring the same? What proportion should be used in factory and also in an office? In the disposal of condensed water should it be permitted to run by gravity into a closed receiver and pumped back into the boiler, or would you advise the use of a common float trap, with discharge to the sewer? What is the best and most practical method of building floor coils, manifolds and return bends, and what provisions are made to keep the pipes in place? Right and left return bends, which are the best? or are two pipe bracket coils to be preferred? What is the practical way of putting up miter coils along the walls, giving the grade and distance of supports for hook plates to screw on? What is the best position for air vents in these different coils, and, finally, what is the most suitable position for back pressure valve and live steam connection?

Answer.—The initial pressure of the steam in the boiler of the engine named not being given we will assume it to be 60 pounds gauge pressure. The engine being stated to be a plain slide valve engine, this implies absence of any special cut off more than can usually be effected with such a valve, or on the average a cut off of about three-fourths of the stroke. Under such circumstances of working it may confidently be assumed that if the engine actually develops 40 indicated horse-power it will discharge from its exhaust at least $45 \times 40 = 1800$ pounds of steam per hour. As usually applied 30 pounds of steam will supply per hour 300 feet in length of 1-inch pipe for heating, or, for an inside figure, say 270 feet, this being about 90 square feet of heating surface. We have, therefore, as a safe figure for the entire heating surface which can be carried by the exhaust of a plain slide valve engine developing 40 horse power, with 60 pounds boiler pressure, $\frac{1800}{30} \times 270 =$ 16,200 feet run of inch pipe, or about 5400 square feet of external surface of such pipe. From this operation we may deduce a rule for calculating the amount of heating surface which the exhaust of such a steam engine will carry.

1. Ascertain the weight of water evaporated by the boiler per hour to run the engine, which may be practically assumed to be the weight of steam in pounds delivered at the exhaust.

2. Divide this weight by 30 (the number of pounds of steam required to supply about 90 square feet of inch pipe radiating surface) and multiply the quotient by 270; the result will be the number of feet in length of inch pipe which the exhaust steam will supply for heating purposes.

This weight of water evaporated per hour may either be calculated from indicator diagrams taken from the engine cylinder, or it may be experimentally determined by weighing the water fed to the boiler. The use of indicator diagrams is the most expeditious and easy way of arriving at the water consumption, but if care be taken an accurate result may be obtained by weighing the feed water.

The use of a float trap for discharge into a sewer of the condensed water would be very uneconomical practice. All the heat contained in this water and thrown away would thus have to be supplied to new feed water. Besides, water after having been evaporated and condensed is in the very best state for use again in the boiler, being freed from air, which is always absorbed in cool water freely exposed for some time to the atmosphere, and having deposited its mineral impurities that produce incrustation in the boiler. Instead, therefore, of allowing the condensed water to run to waste, it ought to be continuously returned to the boiler.

As to amount of pipe necessary respectively for factory and office, this should be estimated with reference to local conditions. If the labor performed in the factory required much muscular exercise, from 60° to 65° of temperature is as much as will be comfortable to the workmen. If the work is light and done by women, and if there is little or no artificial ventilation, such ventilation as is obtained in cold weather being by air entering through crevices at doors and windows, &c, 70° F. will be required; and if the factory floors are, say, as large as 25 x 50 feet in a reasonably well constructed building, a rough approximation to the amount of surface could be made by allowing for such floors 3 feet of inch pipe for every 100 cubic feet of space in the rooms, in a climate where the lowest outside temperature is about 10° F. This is for a large well built factory building, as, for example, a shoe factory containing, say, six such rooms, and employing 30 to 50 people in a room. For smaller establishments it might be necessary to use 3 feet of inch pipe, or its equivalent heating surface, for every 80 or 90 cubic feet of space in the rooms, or even more surface. Only from knowledge of the existing conditions can a proper estimate be made of the heating surface needed for any particular case. For offices the proportion of heating surface ranges from 3 feet of inch pipe to every 40 cubic feet of space to 3 feet for every 60 or 80 cubic feet, according to size, location, usual number of occupants, &c. It is impossible to give a general rule for amount of heating surface as related to size of rooms that will apply to every case.

If our correspondent is favorably located to obtain steam fitters' supplies he can buy coils of inch pipe cheaper than he can make them. It is rarely required to use right and left return bends in making up coils, except when manifolds are used, and unless the situation compels the use of manifolds the latter are not desirable. Plain flat coils of about six pipes with common return bends, if the situation admits, of from 10 to 16 feet in length, or two-pipe bracket coils, are the best whenever they can be used. If these cannot conveniently be purchased ready made they can be made on the premises by any steam fitter who is competent to do even the simplest job of steam heating work. Our correspondent ought not to make the mistake of supposing that such a job as he proposes can be well done by any one except a skilled steam fitter. As to air valves, they should be placed in or near the outlets of radiators. In flat wall coils the steam should enter the upper pipe of the coil and the steam and condensed water pass out of the lower pipe. An even number of pipes in the coil brings inlet and outlet valves to the same end of the coil, which is convenient. Six pipes high in flat coils work excellently.

The position of the valve for admitting steam to the heating system direct from the boiler, which is what we understand our correspondent to mean by "live steam connection," must be governed entirely by circumstances of which we have no knowledge. The most we can say is that the connection should be in a handy place for the engineer who has to use it, and our preference would generally be for an independent connection direct with the steam dome of the boiler. As to back pressure valve, if a suitable trap be used for returning the condensed water, such a valve will not be needed except when the trap needs attention. But a dis-

charge pipe to sewer, attached to pipe leading to trap, with a common discharge trap, ought to be provided, to meet cases whenever some repair or adjustment of the return trap is needed, and the necessary valve in the pipe would, we should think, then be the only back pressure valve needed.

If box coils are to be used they should be purchased direct of the manufacturers of such coils, as they can be bought much cheaper ready made than they can be constructed on the premises, and will be tested and guaranteed by the makers. Such coils will have the needed inclination of pipes, and only have to be set level on proper supports, which are also supplied by the manufacturers. Plain flat coils may be made on the premises. The component pipes of such a coil ought to have an inclination of 1 inch in 16 feet or 1 inch in 12 feet, if this can be got conveniently. Supports for such coils can be bought from any dealer in steam fittings, designed for attachment by screws to wall cleats of wood. About 6 to 8 feet between supports is a usual distance for coils of from 12 to 16 feet in length, and ten feet is near enough for very long coils. For mid floor positions box coils are preferable, as occupying less space. For a mid-floor flat coil supports of 1¼ x ¼ inch merchant bar iron bent at an angle to get a foot that can be screwed to the floor, and drilled or punched to receive through bolts on which the pipes can rest, can be made by a local blacksmith.

In calculating surface for inch pipe coils estimate each return bend as the equivalent of 7 inches length of inch pipe. This is not exact but near enough for practical purposes. Thus an inch coil with 60 feet of inch pipe and 12 return bends would have a surface about equal to 67 feet run of inch pipe alone.

Double Furnaces.

From W. S., *Baltimore.*—When a building is to be heated by means of a warm air furnace, it is usual to employ a single furnace for the purpose, and one that is supposed to be of sufficient heating capacity to warm the building during the coldest weather. Such a furnace would naturally be much too large for heating the building during mild weather, as it would be difficult to keep the fire burning properly without producing more heat than was required. I would like to inquire of the readers of *The Metal Worker* what experience they have had with double furnaces. That is, two small furnaces, their united capacity being sufficient to properly warm the building, and set near to each other and connected by means of a double bonnet. From this bonnet the pipes would be connected with the rooms above in the usual manner. The cold air box could be provided with branches, so that each furnace would receive its proper supply of air. A damper or slide placed in each branch would enable one to regulate the supply of air to each furnace, or shut off the supply if one of the furnaces was not in operation. With only one furnace in use, it is probable the pipes over this one would receive the most heat, but this defect could be obviated to a great extent by regulating the pipe dampers and the registers. The advantages to be derived from this plan would be that during mild weather only one furnace would be used for heating, thus saving fuel. During cold weather the two furnaces would be required.

Kerosene as a Wood Preservative.

From LAMBERT, STOUGHTON & COOPER. *Philadelphia, Pa.*—On page 28 of *The Metal Worker* of December 29 we notice an inquiry from Summit Station, N. Y., as to the preserving qualities of kerosene oil, &c., on wood. For your correspondent's guidance, we would say that crude petroleum is decidedly the best for the purpose he wishes to use it, but we believe that Fernoline is still better than the oil. The latter is used by pile drivers along the Atlantic Coast, and also by railroad companies in some parts for preserving wooden ties. The cost of the latter is more than the former, and if your correspondent would like to know more about it we will furnish him with all the information we possess if he will address us on the subject.

Choked Water Backs.

From J. W., *Virginia.*—The water front in a kitchen range, in this place located in a basement somewhat lower than the main pipe in the street, fills up with lime incrustations about once a year, or sometimes in less time, and has to be replaced with a new one, thereby submitting the owner to no small annoyance and expense. Can you explain the cause of this or suggest a remedy? Is the fault with the range or plumbing? Other ranges similar in construction, except that they are higher than the water main, are not affected in this way.

Answer.—Our correspondent's case would be a simple one, except for his statement that his range chokes up once a year, while others above the water main do not. We do not see what influence the position of the range has in the matter. We think it more likely that the higher ranges have larger water back connections, or for some other reason are not subject to the trouble. This matter has been discussed in the past in *The Metal Worker* and various remedies have been suggested. Our correspondent is, of course, aware that the difficulty is due to the water depositing the lime held in solution, and this forms a crust, the same as it does in steam boilers. The last time the matter was discussed in our columns three separate remedies were suggested. The first was that the water back connections be made of 2½ inch pipe, so that the incrustation would take a very much longer time in forming. This delayed, but did not remedy the trouble. A second suggestion was to make the water back a secondary heater—that is, the connections were made to a coil within the range proper and there was a little expansion tank connected with the upper pipe. In this way the same water was used over and over again and transmitted its heat to the water in the range boiler. After the first deposit had been made there would be no further accumulation. A third suggestion was that the trouble would be obviated by preventing the water ever reaching the boiling point. The correspondent who made that suggestion said that by reducing the size of the water back so that the temperature of the water was kept below the boiling point the alkali was not deposited. He had followed this practice with great success in places where much trouble was occasioned by alkali water. We trust some of these suggestions may prove of assistance to our correspondent.

Rusting of a Tin Roof.

From W. B. K., *Penn's Grove*, N. J.—In answer to the inquiry of "R. H. C.," Grafton, Ill., that appeared in *The Metal Worker* of December 22 about rusting of a tin roof on the bottom, I think he will find that the shingles have been penetrated by either steam or gas from the room below. My opinion is that IC terne, well painted on both sides and kept painted on the top, will last from twenty to thirty years. Putting tin over old shingles is quite practicable, and if a cleat board is used the work can be done as smooth and flat almost as over sheathing. The first thing to take into consideration before putting on a roof is to find out what the room below is to be used for. If for a laundry it is necessary to sheath the roof as tight as possible, and then to use oiled sheathing paper and paint the bottom side of the tin well with metallic brown. If over bedrooms or ordinary dwelling lofts it is not necessary to use either sheathing paper or paint, as the underside of the tin is not apt to rust through in such places. I had a roof last year to take off, and put on a new one, on account of gas from the lodge room caused by stove gases ascending from the room through a ventilating ceiling register in the loft. The ventilator in the roof was, through an oversight of the tinner who had put on the first roof, made independent of the ceiling ventilator and not connected directly with it.

Base Burning Stoves.

From H. H., *Rochester, N. Y.*—Please inform us through *The Metal Worker* when and by whom base burning stoves were invented?

Note.—It is generally supposed that the first magazine or base burning stove designed to heat rooms was patented by David Riz in the year 1770. The principle was applied by James Watt, who, in 1785 was granted a patent for a magazine steam boiler furnace, in which the base of the fuel only was exposed to the direct action of the fire. If our correspondent is interested in going into the subject of the base burning principle a little deeper, he will find in *The Metal Worker* of May 3, 1890, an article entitled "History of the Base Burning Principle as Applied to Stoves, Furnaces, &c," and in the issue of the paper for June 12 of the same year will be found another article bearing on the subject.

TIN PLATES.

Net Weight of Tin Plates.

Through the courtesy of Bruce & Cook, Water street, New York, we are permitted to reprint from their calendar the accompanying valuable table, giving the net weight per box of tin plates, computed on the basis of 10 x 14, 225 sheets; or, 14 x 20, 112 sheets. Referring to this table in their New Year's circular they say:

"During the last few years plates lighter than the old standards have come into such general use that we have made up a table showing the net weights of all leading sizes, and at the basis weights most in use. This will enable you to tell at a glance the weight of the different sizes and thicknesses, and also to be sure that weights received are same as ordered without a long calculation."

There is not a little complaint of the selling of light weight plates for standard, but where it is suspected the use of this table will enable the purchaser to readily check all doubtful boxes.

Net Weight Per Box Tin Plates.

A New Tin Plate Plant.

The Totten & Hogg Iron & Steel Foundry Company of Pittsburgh, Pa., manufacturers of rolling mill, tin plate machinery and engines, have just received one of the largest orders that has been placed with any Pittsburgh company for many years. This order is from the Laughlin Nail Company of Wheeling, W. Va., and is for a complete tin plate plant. The plant will be erected at Martin's Ferry, Ohio, and when completed will be one of the finest, largest and best arranged tin plate plants in the United States. The machinery to start with will consist of six 24-inch hot mills and four 20-inch cold mills, but room has been provided for four more hot mills and three more cold mills, making a total of ten hot mills and seven cold mills. The mill buildings will be made of iron. The tinning house and packing room will be of brick. The hot mill building will be in size 70 x 140 feet and 20 feet high from floor level to lower chords, with shed to cover heating and pair furnaces 20 x 140 feet, and shed to cover annealing furnaces 25 x 140 feet. The cold rolling mill building will be 62½ x 140 feet, 24 feet high from floor level to lower chords, with shed to cover annealing furnaces 25 x 80 feet. The boiler house will be 40 x 88 feet. The tinning house will be 60 x 75 feet, and the packing room 60 x 50 feet. Both the hot and cold mill buildings will be provided with traveling cranes. The Totten & Hogg Iron & Steel Foundry Company have the contract for everything complete, from the ground up, including buildings and furnaces. The machinery they furnish will consist of hot mills complete, with all the doubling and trimming shears; cold mills complete; a 1000 horse-power ÆEtna rolling mill engine complete, with gears and countershafts for driving hot mills; a 700 horse-power ÆEtna rolling mill engine complete, with gears and countershafts for driving the seven cold mills; a 100 horse-power engine with line shafting, bearings and pulleys, for driving doubling and trimming shears, and a 75 horse-power engine for driving the tinning house; a boiler plant complete, to supply steam for the four engines; all the machinery for the tinning house, consisting of six Thomas & White, one Phillips and one Morewood tinning machines, six branning machines, one double and one single dusting machine, one Gray pickling machine, one 1000 horse-power heater, two boiler feeding pumps, each large enough to supply ten 100 horse power boilers with water; one steel water tank, one 38 inch roll lathe, 60 annealing boxes, and all the floor plates required about the plant. The entire plant was designed by F. I. Freeman, the mechanical engineer of the Totten & Hogg Iron & Steel Foundry Company, who will himself, assisted by his son, S. L Freeman, take charge of the erection and starting of the plant at Martin's Ferry. The Totten & Hogg Company also have an order for changing the nail plate train, which was built by them for the Laughlin Nail Company many years ago, into a train for rolling the sheet bar for the new plant and to furnish the new shears and roller tables for same. This arrangement enables them to cut the sheet bar to proper lengths as fast as it is rolled.

SCRAP

A UNITED PRESS CABLE DISPATCH from London of January 6 reported as follows: "Many tin plate works in the Swansea district are closing their contracts. Some 3000 men were discharged yesterday in accordance with previous notices. The cause of the reduction is the decrease of the American demand. T. N. Hood, London agent of the Glanrhyd Tin Plate Company, told the United Press correspondent yesterday that some time ago the Welsh tin platers extended all their facilities in anticipation of a heavier demand from the United States, but the demand had not come and the new plants are useless. Tin plate prices now, he said, were the lowest on record." From other sources of information it appears more likely that the closing down of so many works is primarily due to the failure of the makers to come to a settlement of the wage question with their workmen.

THE ANNUAL REPORT of the New York Chamber of Commerce for the fiscal year ending June 30, 1894, places the value of foreign tin and terne plates and taggers tin entered at this port during that period at $7,167,814. The aggregate receipts at all other ports are estimated at $7,442,474, making the total value of tin plate imports $14,610,488.

IN OUR ALPHABETICAL LIST of American tin plates in last week's issue the name of Clifton, a bright charcoal plate, manufactured by Follansbee Bros. Company, successors to James B. Scott & Co., Pittsburgh, Pa., was inadvertently omittted, although noted opposite the firm's name on page 42.

THE PROJECT of erecting a co-operative tin plate plant by former employees of Wallace, Banfield & Co., Limited, at Irondale, Ohio, has been abandoned.

THE CRESCENT SHEET & TIN PLATE COMPANY, Cleveland, Ohio, expect to begin the manufacture of black sheets about April 1. The company will ope-

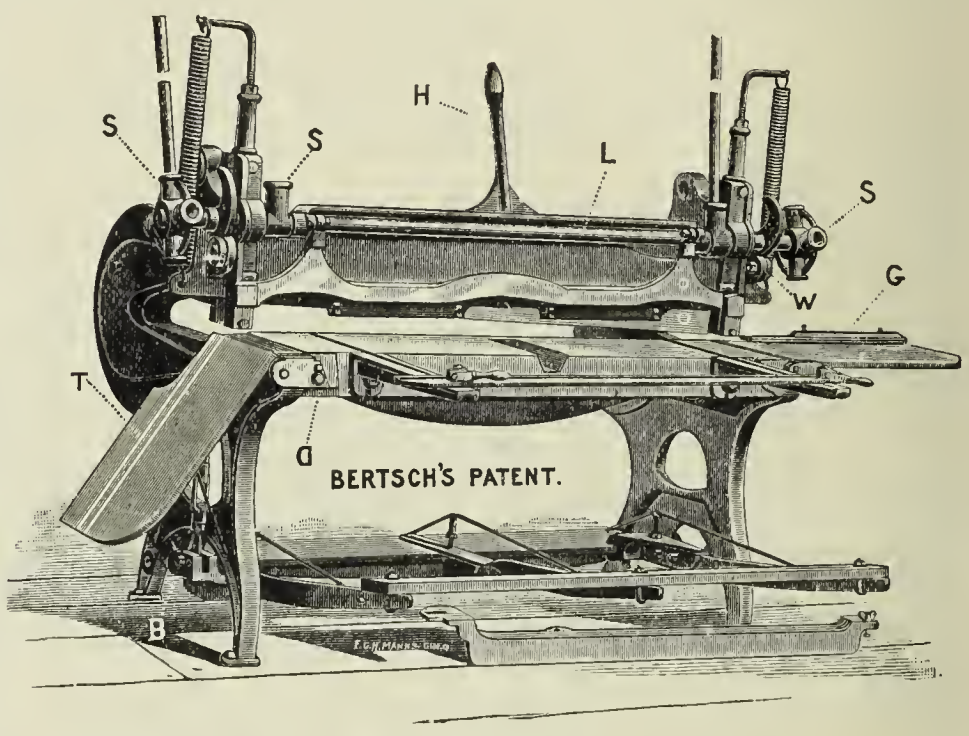
rate this department of their plant first, and later on the manufacture of tin and terne plates will be taken up. The buildings now in course of erection are a steel hot mill building, 105 x 175 feet, and a combination building containing the annealing, pickling, cold rolling, tinning and warehouse departments, which will be all steel and brick, 105 x 168 feet, with a wing 48 x 48 feet. The buildings are being put up by the Shiffler Bridge Company of Pittsburgh. The Industrial Works, Bay City, Mich., have the contract for the supply of two electric cranes, and the Elwell-Parker Electric Company, Cleveland, Ohio, will furnish a generator to run these cranes, together with 15 arc and 60 incandescent lights.

THE JUNCTION IRON & STEEL COMPANY of Mingo Junction, Ohio, formerly the Junction Iron Company, and who succeeded to the business of the Laughlin & Junction Steel Company recently, announce that after February 25 next they will be prepared to supply soft steel tin plate and sheet bars "boshed," and cut to any desired length and rolled to any thickness from ⅛ inch up; also small steel billets from 1¼ inch, square or round, up to 3 inches. These billets will be of the grade of goods known as raw materials for the manufacture of street and railway cars, agricultural implements, bolts, wagon and carriage axles and many other lines of iron and steel goods. Contracts have been placed for the additional machinery, and the work of installing will go forward as rapidly as possible.

THE TIN PLATE PLANT of the Ellwood Tin Plate Company, Ellwood City, Pa., is now in operation to nearly full capacity. Three mills are running, and the tinning department will probably be put in operation this week. As is already known, this concern are running on a non-union basis, and have experienced but little difficulty in finding competent workmen as fast as places could be made for them.

THE MONTHLY RETURNS of the British Board of Trade for December show the total exportation of tin plates from British ports during that month to have been 38,000 tons, against 23,000 tons in December, 1893. Of this amount 24,000 tons were shipped to the United States, as compared with 14,000 tons in the last month of the previous year. The total exports of tin and terne plates from Great Britain to this country last year aggregated nearly 205,000 tons against 255 500 tons in 1893, a falling off of over 50,000 tons.

THE AMERICAN TIN PLATE COMPANY, Ellwood, Ind., will start up a new addition of four mills about January 15, when some 250 more men will be given employment at their works.



A CABLE from Liverpool, England, announces the death on January 6 of Henry Nash, the head of the well-known house of Henry Nash & Co., tin plate and metal merchants of that city. Mr. Nash, who was among the most prominent members of the trade, was well known in the United States as representing a number of the largest metal houses in this country.

BENJ. MORRISON, who for some time has acted as the representative of N. & G. Taylor Company, at 23 Water street, New York City, has resigned his position and severed his connection with the firm. Mr. Morrison will, it is understood, embark in the metal business on his own account.

THE CALENDAR for which we are indebted to James A. Coe & Co., 106-108 Mulberry street, Newark, N. J., is an exceedingly appropriate and handsome publication. The calendar proper, which is a pad of 12 leaves attached to the bottom of the card, is neatly printed and plain, and carries beneath it the full calendar for the year in blue ink. The feature of the publication, however, is the card itself, which has a background of silver that is a perfect imitation of fine terne plate. The firm name, with the announcement "Iron and Steel, Bright Tin, Roofing Plate, Copper, Zinc, Solder, Carriage and Heavy Hardware," is printed in white, with a blue shade line.

Extra Heavy Gap Shear.

We show in the accompanying illustration a type of the extra heavy No. 22 5-foot 15-inch throat gap shear for No. 14 iron, built by Bertsch & Co, Cambridge City, Ind. The patent lever attachment L in front of the knife bar has extra heavy sockets, S, at both ends, and is also operated in conjunction with the treadle for heavy work. For ordinary or light work the treadle can be used entirely independent of the lever. It is pointed out that with this attachment the gap shear is complete, and for squaring and slitting is practically two machines in one. It is made for all lengths up to 6 feet or longer for light work, with 12, 15, 18 and 21 inch throat. The shears are made to be operated by either hand or power. Particular attention is called to the patent extension drop leaf table with parallel gauge, G, which is described as indispensable for continuous accurate cutting of long sheets. It is also pointed out that it will facilitate the work and avoid marking off in slitting and trimming sheets, as the gauge is adjusted in line with the blades, properly guiding the sheet through the throat. The extension table on the left has suitable parallel shearing lines, T, for trimming, and a special shear line indicator is attached to the last cutting end to indicate the cutting edge of the lower blade, which can be seen at the end when cutting metal that is longer than the blades.

Extra Heavy Gap Shear.

Trade in Tinners' Tools.

A firm of Eastern manufacturers, making a heavy line of tinsmiths' machines and tools, writing on the condition of trade refer to the three kinds of competition which they have to struggle with, and classify them as follows:

1. *Honorable Competition.* This seeks to improve the quality of its product and cheapen its cost of production, giving to buyers their just share of such improvement.

This kind of competition benefits everybody.

2. *Ignorant Competition.* This rises from inexperience, or from careless or defective bookkeeping. The manufacturer does not know what his goods cost, nor how much to allow for incidental expenses and unforeseen emergencies. Consequently his selling prices demoralize the market for a time, resulting at last in his own ruin. Then his plant goes into a receiver's hands, his stock is sold below cost and his plant is bought up by some speculator as ignorant as himself, and the same experience is repeated over and over again till the last brick and the last dollar are gone.

This kind of competition benefits nobody.

3. *Rascally Competition.*—In this the competitor sells deliberately and knowingly on an insufficient margin, either for the sake of grasping the whole world or of ruining his competitors.

This kind of competition is the bane of business, and pleases no one but the devil and his angels.

Almost all the East Liverpool, Ohio, potteries started into operation last week on full time.

The *Journal of Commerce* estimates the fire losses of the United States and Canada for the year 1894 as $127 450,000. The 1893 losses were $156,445,875 and those of 1892 $132,704,700.

The Philadelphia *Ledger* estimates that the production of anthracite coal in 1894 will aggregate over 41,000,000 tons, a decrease of over 1,600,000 tons compared with the output of 1893.

ROOFING AND CORNICE.

National Association of Iron Roofing Manufacturers.

(*By Telegraph.*)

The ninth annual meeting of the National Association of Iron Roofing Manufacturers convened in parlor A of the Burnett House, Cincinnati, Ohio, Thursday, January 10, with President E. E. Souther of St. Louis in the chair. At 9 a.m., the meeting having been called to order by the chairman, an invitation was extended to the manufacturers of galvanized iron conductor pipe, eave trough, elbows and fittings, who had met on Wednesday for the purpose of organizing an association, to be present, which was accepted by many.

After a speech by the president the report of the Executive Committee was read and adopted, as was also that of Secretary and Treasurer Hyndman. The appointment of a committee to nominate officers to serve the ensuing year, composed of A. L. Andrews, J. E. Annis and E. C. Ewing, was followed by a resolution, which was carried, to omit the No. 27 gauge when quoting prices on corrugated or roofing iron, and otherwise confining such quotations as much as possible to the even gauge. This is quite an important feature, and will commend itself to all manufacturers whether members of the association or not.

A second committee, composed of J. G. Battelle, G. E. Needham, H. P. Lloyd, Joseph Blechle and R. F. Graham, was instructed to formulate and suggest additional plans for improving present low prices and to deal with the unsatisfactory condition of the iron roofing business. Adjournment of morning session was then taken, to meet again at 2 p.m.

Afternoon session was called to order at 3 p.m. A number of suggestions and plans for improving the condition of the business and establishing better prices were passed upon, but no definite action was taken, the meeting adjourning with the election of the following officers for the ensuing year, who will also act as an Executive Committee:

President, J. C. Biechle of the Berger Mfg. Company, Canton, Ohio.

Vice-president, Chas. H. Conner of Chas. H. Conner & Co., Louisville, Ky.

Secretary and treasurer, R. J. Hyndman of the Hyndman Iron Roofing Company, Cincinnati, Ohio.

At the close of the meeting an elaborate banquet was tendered to the visiting and local members of the association and press by the American Roofing Company, Globe Iron Roofing & Corrugating Company and the Hyndman Steel Roofing Company, Major H. P. Lloyd acting as toastmaster.

Following is a list of members in attendance at the meeting:

Chas. H. Conner, Louisville, Ky.
Columbia Corrugating Company, Chicago.
Jas. A. Miller & Bro., Chicago.
Allen's Corrugating & Cornice Works, Chicago.
Acme Roofing Company, Canton, Ohio.
Chattanooga Iron & Steel Company, Chattanooga, Tenn.
Wheeling Corrugating Company, Wheeling, W. Va.
Fostoria Steel Roofing Company, Fostoria, Ohio.
Rhodes, Dickelman & Co., Forest, Ohio.
Berger Mfg. Company, Canton, Ohio.
J. H Eller & Co., Canton, Ohio.
Kanneberg Roofing Company, Canton, Ohio.
Cincinnati Corrugating Company, Piqua, Ohio.
Acme Roofing Company, Canton, Ohio.
Garry Iron Roofing Company, Cleveland, Ohio.
E. E. Souther & Co., St. Louis, Mo.
American Roofing Company, Cincinnati and St. Louis, Mo.
Canton Steel Roofing Company, Canton, Ohio.
Cambridge Roofing Company, Cambridge, Ohio.
Ætna-Standard Company, Bridgeport, Ohio.
Globe Iron Roofing Company, Cincinnati, Ohio.

Eave Trough and Conductor Pipe Manufacturers.

A representative gathering of the Galvanized Iron Conductor Pipe, Eave Trough and Elbow Manufacturers of the United States met in session at the Burnet House, Cincinnati, Ohio, Wednesday, January 9. The meeting was called to order by Chairman T. C. Snyder of Canton, Ohio, and the roster being read the following firms were shown to be in attendance or represented, viz :

W. Austin Obdyke & Co., Philadelphia, Pa.
Marlin & Co., Alleghany, Pa., by H. A. Marlin.
Thomas Lee, Cincinnati, Ohio.
Acme Roofing Company, Canton, Ohio.
Chattanooga Iron & Steel Company, Chattanooga, Tenn., by J. E. Annis.
Wheeling Cornice Company, Wheeling, W. Va., by E. C. Ewing, Alex Glass, W. L. Ewing.
Clark, Quien & Morse, Peoria, Ill.
Fostoria Steel Roofing Company, Fostoria, Ohio.
Canton Steel Roofing Company, Canton, Ohio, by T. C. Snyder, president.
Rhodes, Dickleman & Co., Forest, Ohio, by F. B. McMillin.
Berger Mfg. Company, Canton, Ohio, by E. Langenbach, secretary; J. Blechle, president.
J. H. Eller & Co., Canton, Ohio, by J. H. Eller, president.
Kanneberg Roofing Company, Canton, Ohio.
Cincinnati Cornice Company, Piqua, Ohio, by J. G. Battelle and James Hicks.
Acme Roofing Company, Canton, Ohio.
Bowers & Galpin, Binghamton, N. Y.
Columbia Corrugating Company, Chicago, Ill.
Jas. A. Miller & Co, Chicago, Ill.
David Lupton Sons, Cleveland, Ohio.
Allen's Corrugating & Cornice Works, Chicago, Ill.
Ferd. Dieckmann, Cincinnati, Ohio.
Miller Iron Company, Providence, R. I.
Scottdale Iron & Steel Company, Scottdale, Pa., by T. F. Graeser.

The object of the meeting was principally to discuss rules and regulations governing the production and sale of the material in question, such as standard measurements and uniform price-lists. At present the difference in sizes of pipe are not at all consistent with the existing list, this being also the case with eave trough. Under the present system in vogue manufacturers have learned that while a profit was assured in the sale of a certain size, based upon the existing list price, yet there proved to be a considerable loss when another size was in question. The matter of reduced freight classification is also another important feature that was deliberated upon, although much had already been accomplished in that direction through the personal efforts of T. C. Snyder, chairman, previous to the present meeting.

A principal feature discussed was the fact that the industry is thoroughly overdone, the manufacturer protesting that not one of them is making a single

dollar profit. No suggestions that could be immediately adopted were brought forth, and with the exception of making several changes in the present price-list nothing was done.

The election of officers resulted as follows:

President, C. D. Clark of Clark, Quien & Morse, Peoria, Ill.

Vice-president, E. L. Langenbach of Berger Mfg. Company, Canton, Ohio.

Secretary and treasurer, Alex. Glass of Wheeling Corrugating Company, Wheeling, W. Va.

One fact was emphasized very strongly, that having reference to the productive capacity of the manufacturers of the goods in question, it being stated that the total number of feet sold in 1894 amounted to between 7,000,000 and 10,000,000, while one concern alone was capable of producing 15,000,000 feet, there being several others possessing almost equal productive facilities. The title of the organization is the United States Eave Trough & Conductor Pipe Association.

Sheet Metal Class at the Pratt Institute.

The sheet metal pattern cutting class at the Pratt Institute Trade School, Brooklyn, has entered on its second quarter's work with most encouraging prospects. Instructor Louis Rouillon speaks in enthusiastic terms of the intelligent interest displayed by the pupils and the progress made by them since the class was started. In this second term the pupils are being taken into the practical sphere of sheet metal pattern cutting, including roofing and cornice work. Both Mr. Rouillon and Professor Richards express themselves as being eminently satisfied with the results so far attained by this new class. Naturally, at the start, it is more or less in the nature of an experiment, and the hard times have prevented a number of candidates who wished to enter the class from doing so. By the commencement of the next season, in September, however, it is expected that a much larger number of applicants for instruction will present themselves. Mr. Rouillon is now drawing out a detailed scheme of instruction, which he proposes to follow, and by which the pupils will be provided with as thorough an education, theoretical and practical, in sheet metal work as possible. The class is held on three evenings of the week, Monday, Wednesday and Friday, from 7.30 to 9.30; and the regularity of the pupils in their attendance is reported as very gratifying.

KURTZ & Co, 2427–29 Calumet avenue, Chicago, are to furnish the copper cornices, bay windows and skylights for the residence of George F. Harding, Thirty-eighth street and Elmwood place.

The Roofing Trade in the West.

The following extract from a letter with which we have been favored by a large roofing concern in the West presents a cheerful view of the outlook for the roofing trade in that section of the country: "Take it all in all, they write, the outlook for business in our line in Missouri, Kansas, Oklahoma and Indian Territories is decidedly brighter than at any time for the last three years, except, possibly, in the early part of 1893, when everything opened very auspiciously till interrupted by the great panic. But we think our expectations for 1895 have a better foundation than in the spring of '93, for the reason that plans for improvements at that time were rudely shattered by the panic, though not in many cases entirely abandoned, and many cherished plans have developed and accumulated since, awaiting only an opportune time for execution. This now seems to be at hand. We are receiving inquiries and a few scattering orders from old customers whom we have not heard from for even as long as four and five years; and in answer to inquiries as to why we have not heard from them before, the almost universal reply is that they have not needed anything in our line. This we take as one of the very best indications of a revival of business, and that, coupled with the very low ruling prices, we think will undoubtedly make business good."

FLASHINGS.

THE KNISELY & YELDHAM COMPANY, 68–74 West Monroe street, Chicago, are to furnish the copper work for the residence of Frank J. Wilson, Washington boulevard and Sacramento avenue.

KNORR & BLOCKS, 165 Wells street, Chicago, are to furnish the cornices, skylights and tin work for the building of Lystad & Anderson, 296–298 East Division street.

THE DAY CLASS in tinsmithing, roofing and cornice work, which was to open on January 2 at the New York Trade School, was not started owing to the insufficient number of applications. This is to be regretted, as a competent instructor had been secured and an elaborate course had been decided upon. After it was decided not to open this class, additional applications were received sufficient to warrant its beginning, but unfortunately too late to change the decision. Another attempt, however, will be made next year to start this class. The course of instruction was intended to qualify pupils to work both tin and sheet iron, and teach them all the little tricks of the trade which oftentimes are only secured after a long experience and without which a workman labors under a disadvantage. In addition to this, instructions would have been given in the laying out of work and cutting such irregular shapes in sheet metal as are daily found necessary in this trade.

EMIL SCHAEFER was given the contract for the erection of a three-story, 36 x 40-foot shop at 1321 North Fifth street, Philadelphia, which will be used for the manufacture of sheet metal goods.

JOSEPH JAMES, miner of actinolite, Bridgewater, Ontario, advises that the demand for that material for roofing purposes during the year 1894 showed a very marked increase. He reports having disposed last year of 15,000 bags of 100 pounds each. The principal markets to which he caters are Chicago and Montreal, Canada. He also finds a good trade in Detroit, Mich.; Toronto and Hamilton, Canada, and even as far south as Nashville, Tenn. New markets, he says, are constantly opening up for this material.

THE MONTROSS METAL SHINGLE COMPANY, Camden, N. J., report that their business during the past year was very satisfactory, and that their output showed an increase of about one-third on that of 1893. They are preparing to add new presses and other machinery to their plant with a view to still further increasing their capacity. Among the new goods they contemplate introducing very shortly is a new siding plate, which they believe will be much appreciated by the trade.

THE CARBON PAINT COMPANY of New York City have been incorporated to manufacture water proof and fire proof paints, and to take contracts for roofing. The capital is $100,000, and directors, William Calhoun, Chas. B. Hearn and Thomas D. Prentiss of New York City.

J. J. COLVIN, 79 La Salle street, Chicago, is to furnish the galvanized iron work for the residence of John C. Thompson, North Robey street.

THE ROME MFG. COMPANY, Rome, N. Y., make a fine display of planished and nickel plated copper goods at their New York office at 92 Walker street. Their line of tea kettles begins with the tiny individual kettle and, including the "five o'clock tea," continues to the many styles and sizes for kitchen use. They also make a varied line of handsome tea and coffee pots. Wash boilers of planished copper in all sizes are another of their specialties.

THE STAR DINNER PAIL COMPANY, Allegheny, Pa., have filed a bill in equity in the United States Circuit Court against W. B. Berteles, Son & Co. of Wilkes-Barre, Pa., alleging infringement of a patent pail attachment known as an "ear." The case was argued and decision was reserved.

R. M. WILSON, Rome, N. Y., has many things to interest the plumber at his New York office, 92 Walker street. One is a nickel plated copper boiler that is made for ordinary pressure, or special, to stand high pressure. It is pointed out that the nickel plated boiler is more sightly in kitchens than a copper boiler when the discoloration begins and that the nickel will stand a long time. These boilers can be furnished in sizes up to 100 gallons. They also carry a stock of all sizes and weights of copper lined bathtubs and guarantee the weight of the copper to be as stamped on the tub. One of their specialties is a copper lined tub in hardwood finish, set on nickel plated feet and adapted for the use of outside waste and overflow. This tub is gaining popularity as a sanitary tub and because no carpentry work is required. A wide line of closet tanks and seats of fine grade are also carried, as well as nickel plated bath cocks and basin traps.

THE WISCONSIN STATE ASSOCIATION OF MASTER PLUMBERS held their annual meeting in Milwaukee this week, electing officers for 1895 and discussing improvements in the plumbing laws.

Ventilation.

BY GEO. D. HOFFMAN, CHICAGO.

What a wealth of meaning in the term "ventilation," and yet how few, even among the heating trade, appreciate its full significance. Perfect ventilation of our homes, offices and schools would mean health, happiness and long life. It would also insure such an increase of our vital forces that we would, inside of three generations, be noted among the nations of the earth as the most progressive and most contented. If any one doubts this statement, let him simply stop and think for a moment of the men who are foremost in the line of the world's action. Read the history of their lives, and you will invariably find that these men laid the foundation of their strength and vitality by spending a large portion of their early lives out of doors and amid surroundings that insure a bountiful supply of fresh air every day. A large number of our American statesmen began their lives on a farm and were of necessity compelled to labor long hours in the open air, and at night rettred to rest in rooms which were full of cracks and crevasses through which the air flowed freely. Fresh air! What magic there is in thy touch! The sick made well, the poor and depressed in spirits again see life through rosy glasses after close relations with thee! And yet, while ventilation is only the insurance of a full supply of fresh air in our habitations, there is not only indifference to its introduction, but actual opposition; and this opposition does not always come from ignorant people in the general acceptance of the term, but from architects and other professional men who should know better. The old saying, "Where ignorance is bliss 'tis folly to be wise," is hardly applicable in this case, as ignorance here is so surely followed by evil results that the saying should be reversed and bliss should follow wisdom.

Pure Air and Foul Air.

I could cite any number of leading authorities, and read whole chapters showing the necessities of ventilation and the evil consequences that result from breathing of impure air, but a mere statement of the component elements of air will suffice for this article. If we divide air into 10,000 parts, its composition will be as follows: Oxygen, 2096; nitrogen, 7900; and carbonic acid, 4 parts. When the proportion of carbonic acid in a room is increased from the normal amount of four parts in 10,000 to between six and seven in 10,000, a faint, unpleasant odor is usually perceptible to one entering from the fresh air; if the proportion reaches ten parts the room is said to be close. According to some authorities a full grown man at rest will exhale through the pores of the skin and from his lungs nearly ¾ cubic foot of carbonic acid per hour. Taking a room containing 2500 cubic feet of air in its normal conditton, we find that the air contains 1 cubic foot of carbonic acid. Now, let us suppose this room to be a sleeping room, not ventilated, occupied by two persons eight hours each ntght. If the windows and doors of the room were closed during the eight hours, thc natural portion of carbonic acid would be increased to about 13 cubic feet (or one part to 200), and the occupants would arise in the morning with depressing headaches. A person coming into the room from the outside would declare the air to be "foul," and a man does not need to be a crank on ventilation to reach the conclusion that such a situation would be anything but healthful. This condition could be obviated, to a certain extent, by raising the windows, but that practice is dangerous in its results, is a prolific source of colds and sickness, and as a means of ventilation totally unreliable, not to mention the morning's discomfort of arising in a cold room.

Function of Ventilation.

But what is ventilation? Ventilation is the process of replacing foul, impure air in a confined space, with pure fresh air. Please note the word "replacing." Some very high authorities define ventilation as the process of simply diluting the confined foul air with fresh air sufficient to maintain a certain standard of purity, but in the writer's opinion the word replacing more clearly defines the process in common practice among heating engineers. Especially is this true in winter, as the fresh air is generally heated to a higher temperature than the air in the building, and as the colder air is a denser, heavier body than the warm air, the result is a gradual displacement of the cold impure air by warm fresh air.

The question which naturally presents itself at this point is the quantity of fresh air necessary to insure anywhere near perfect ventilation. Authorities differ radically on this question, but the majority seem to favor 30 cubic feet per minute per person, or 1800 cubic feet per hour. With this data in mind it is very essy to determine the amount of fresh air necessary to furnish each hour by multiplying 1800 cubic feet by the greatest number of persons occupying the building at any one time. In making this computation it is also necessary to take into consideration the number of gas lights burning. A simple gas jet burning full head will vitiate about 1800 cubic feet per hour per cubic foot of gas burned. Ordinary gas burners are rated to consume from 3 to 4 cubic feet per hour, and if we take the maximum quantity we have each light requiring 7200 cubic feet of air per hour while burning. Some writers argue that as gas jets, generally speaking, are only in use for an average of six hours per day of 24 hours, that the quantity of air required for lights should be divided by 4, so as to distribute the volume of air required over the 24 hours. In the writer's opinion this is all wrong. An ordinary, good system of ventilation should supply the maximum amount of air required during given hours of the days. Suppose, for instance, we adopted the rule for distrlbuting the gas vitiation over the 24 hours, then, so far as the gas jets are concerned, we would only have to provide for one-quarter of 7200 cubic feet, or 1800 cubic feet, per hour for each gas jet. Now, let us see how this would figure out. For example, take an ordinary ten room house, containing 20,000 cubic feet of air, occupied by stx persons, burning six jets during six hours. Giving each person 1800 cubic feet per hour and each gas jet 7200 cubic feet per hour, we have a total consumption of 54,000 cubic feet per hour. If, now, we have only allowed 1800 cubic feet for each gas jet and 1800 cubic feet for each person per hour, we would only have a total of 21,600 cubic feet, or a shortsge of 32,400 cubic feet. Allowing the air in the house to be perfectly pure when the gas was first lighted, by the end of the first hour we would still have a shortage of 12,400 cubic feet. In the above example the writer's opinion is that provision should be made for supplying 54,000 cubic feet of fresh air per hour.

Size of Vents.

Given the whole quantity of air necessary, the remaining question to be determined is the size of the outlet and inlet pipes. The velocity of the air movement in these pipes is, of course, the real key to the solution of the question. Where only natural forces are employed in moving the air, these velocities must vary according to the temperature of the air first, htght of vent shaft second, and amount of frictional resistance third. The greater the difference between the temperature of air in the vent shaft and the outside the greater the velocity, the higher the shaft the greater the velocity, and the more direct the connection between the room to be ventilated and the main shaft the less the loss of velocity by friction. In ordinary work this loss of velocity by friction is considerable, and while it is a very simple problem to determine what the velocity of the air in the vent pipes would be if it were not for this question of friction, with friction in the calculation it becomes more or less a question of guess work. Most authorities, however, seem to agree that this loss will average between one-third and one-fourth of the total volume of air which would pass through a certain sized opening if the loss by friction were not considered. Or in other words, after determining the initial volume of air, deduct one-third or one-fourth of this amount, and the remainder will be the actual volume of air passed.

Velocity Due to Temperature.

In determining the initial velocity of the air in a given shaft we must know, 1, the difference in temperature between the air in the shaft and the outside temperature, and 2, the hight of the shaft. In measuring the hight of the shaft measure from the lowest vent opening to the top of the shaft. With these quantities known, the question resolves itself to a simple calculation of the difference of specific gravity between the column of heated air in the shaft and a column of cold air on the outside. Air expands, when heated, one-four hundred and eightieth of its volume for each degree of Fahrenheit that the temperature is raised from 32° to 212°. If the air in the shaft is 30° warmer than the outside air, the volume of air in the shaft would be increased 30 times one-four hundred and eightieth, or thirty-four hundred and eightieths, or one-sixteenth. With a shaft 32 feet high the air would be expanded one sixteenth of 32 feet, or 2 feet; or, in other words, it would take a column of the heated air 34 feet high to balance a column of he external air 32 feet high. As it would be impossible to maintain this higher column of heated air so long as there was a free exit at the top of the shaft, the result would be a constant influx of air through the vent openings and a corresponding efflux from the top of the shaft.

The old saying that "water always seeks its level," is equally true of air. The colder, denser air will always displace the hotter, lighter air by reason of its greater weight or specific gravity. The velocity with which the outer air would rush into the shaft is determined by the velocity which a heavy body would acquire in falling through a space equal to the difference in the hight of the two columns of air. In

the above example we have the external column 30 feet, and the column in the shaft 32 feet, or a difference of 2 feet. The velocity of air in the shaft, therefore, would be equal to the velocity a heavy body would acquire in falling 2 feet. A heavy body falling freely through space will fall 16.1 feet in one second, while in two seconds, by the principle of accelerating forces, it will fall 64 4 feet; thus falling during the second second the difference between 64.4 feet and 16 1 feet, or 48.3 feet. The pulling force of gravity alone is equal to the distance a body will fall in one second, which is 16.1 feet; deducting this from 48.3 feet we have 32.2 feet, the initial velocity during the second second. It is this initial velocity we wish to ascertain to determine the velocity of the air in the shaft in the above example.

Table of Velocities.

The rule for this calculation is as follows: Multiply the difference between the hight of the heated column and the hight of the external air by 64, and the square root of the product will be the initial velocity of the air. In the example above the difference between the hight of the two columns is 2 feet. The example would resolve itself thus, $\sqrt{2 \times 64} = 11.31$, the initial velocity of the air in the above shaft in feet per second. Deducting the loss caused by friction, which is estimated at one-quarter, we have an actual velocity in round numbers of 8 feet per second, or 480 feet per minute, for each square foot of area in the shaft.

From the above we can easily deduce the following table:

Hight of vent shaft in feet.	Excess temperature of air in shaft over external air.											
	5°	10°	15°	20°	25°	30°	35°	40°	45°	50°	55°	60°
10...	116	164	201	233	260	284	307	328	348	367	385	402
20...	164	232	285	330	368	404	434	465	492	519	545	568
30...	201	284	347	403	450	493	531	568	603	634	666	796
40...	235	329	403	465	518	570	614	656	696	734	769	804
50...	260	367	450	518	579	635	686	734	778	820	861	899
60...	284	402	492	568	632	696	751	804	853	900	943	985

In making the above table I have taken no account of the wind pressure, which, of course, in all calculations should have somewhat of a bearing. A high wind blowing over the top of a shaft will naturally accelerate the velocity, while a heavy cloudy day will have just the opposite effect.

These calculations are based on the movement of the air in the shaft, and independent of outside influences.

In determining the size of the fresh air inlets the question of leakage should be taken into consideration. While there is an evident effort on the part of all builders to make houses practically air-tight, it seems to be almost a physical impossibility to do so. In the opinion of the writer this leakage will vary all the way from 15 to 30 per cent. of the total volume of fresh air required. It is a very easy matter to determine which one of these percentages would be applicable to any given building by carefully examining the doors, windows and other outside openings, and the general construction of the building itself. Where the question of heating through indirect or hot air registers is taken into consideration, the inlet or hot air registers should be fully as large, if not larger, than the outlet registers. By having the inlet registers larger than the outlet we are thus able to put an air pressure in the room heated and ventilated, and thus avoid any possibility of drafts.

NOTE —Authorities consulted in making up the tables and calculations in this article are "Hood on Hot Water Heating," "Encyclopedia Brittanica," and current articles in the various scientific magazines.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

GEORGE H. MARSH, Spencer, Mass., was awarded the contract for the steam fitting at W. A. Barr & Son's shop, which is expected to be ready for business about January 15.

PLUMBER J. H. ALVORD, Winsted, Conn., has the contract for heating the Gillette House on Case Park.

J. B. FARNSWORTH, Leominster, Mass., has been engaged to furnish the plumbing for the new dormitory and academy buildings in South Lancaster.

WE LEARN from the New Haven *Record* that Langdon & Daly, North Main street, Hartford, Conn., have the contracts to do the hot water heating, plumbing and gas fitting in the elegant new residence of Horace J. Wickham of Manchester, also the hot water heating, plumbing and gas fitting of C. A. Ensign's mansion, at Tariffville.

D. E CROUCH has the contract for building a house on West Main street, Norwich, Conn., for Frank L. Lathrop. Tompkins & Murphy are doing the plumbing.

ROBERT BROWN, Norwich, Conn., is fitting up a new bathroom in W. N. Blackstone's residence on Washington street. He has also just finished a fine piece of plumbing in C. S. Johnson's house on Washington street.

ALBERT A. PECK and Daniel E Crouch are erecting residences at Norwich, Conn., that will have a plumbing system and will be heated with Winchester boilers.

A NEW PAROCHIAL RESIDENCE will be erected for the Rev. P. Fox in Newtown, Conn. A copper lined water tank will be placed in the attic and a plumbing system will be put in. The house will be heated by hot water.

ARCHITECT JACKSON has awarded the contract for the heating and ventilating of the St. Bernard's Parochial School, at Rockville, Conn., to the Underhill Warming & Ventilating Company of Boston.

THE SOUTHERN HEATING COMPANY, Louisville, Ky., are installing new hot water systems in both the Y. M. C. A. and Y. M. H. A. gymnasiums, for making hot water for bath purposes.

THE JOHN DAVIS COMPANY, 69–79 Michigan street, Chicago, are to install a steam heating plant in the building of E. S. Pike, 79–81 Fifth avenue.

THE BAKER & SMITH COMPANY, 193–197 Van Buren street, Chicago, have the contract for steam heating in the new building at 194–196 same street.

CONLON & MONTGOMERY, 33 Dearborn street, Chicago, have contracts for steam heating in the large apartment building at Jackson and Lytle streets, and in the residence of Thomas Engel, Evergreen avenue.

THE SAMUEL I. POPE COMPANY, 237 Fifth avenue, Chicago, are to install a heating and power plant in the building of Durand & Casper, West Lake and Union streets.

F. B TRIPP of Cottage City, Mass., has received a contract for the warming and ventilation of the new eight-room school building at that place. The plans and specifications presented by Mr. Tripp were prepared by James A. Harding, formerly with the Boynton Furnace Company of New York.

MONTGOMERY & PATTISON, 258 West Eighteenth street, New York, have the contract for plumbing a double set of officers' quarters on Governor's Island, the plumbing in the Ninth Regiment Armory, and some apartment houses on 165 h and 71st streets.

AT A RECENT TOWN MEETING in Millis, Mass., the town voted $5000 for a heating apparatus in the Adams School Building.

THE COMMITTEE ON BUILDINGS of the city of Jackson, Mich., will advertise for bids for the extension of the steam heating system throughout the county buildings. The expense is limited to $1200.

THE CHARLES H. SIMMONS COMPANY, 72–74 Market street, Chicago, have the contract for steam heating in the residence of MRS. L. B. Vincent, Grand boulevard and Forty-first street.

T. C. BOYD, 38 Dearborn street, Chicago, reports the following contracts for plumbing, gas fitting and sewerage: Morgan Flat Building, Dearborn street and Archer avenue, Thomas Hawkes architect; residence of D. W. Potter, 46 Drexel boulevard, F. W. Perkins architect; building of Durand & Casper, 163–167 West Lake street, S. W. Randolph architect; also remodeling the plumbing in the old and completing the plumbing in the new factory of Norton Bros., Maywood, Ill., F. R. Schock architect.

JONES & JAEGER, 80 Greenwich avenue, New York, are using an Electric steam boiler in heating a large saloon and restaurant in Jersey City, N. J.

CHAS. W. GRAVES, 62 North Clark street, Chicago, is to install a Florida steam boiler in the residence of J. Rosberg, Humbolt boulevard and Western avenue.

E. BAGGOT, 169–171 Adams street, Chicago, has the contract for the plumbing, gas fitting and sewerage in the apartment building of John R Hoxie, Michigan avenue and Forty-fifth street.

METZ BROTHERS, 107 Twenty-second street, Chicago, have the contract for combination heating in the residence of Dr. V. A. Pierce, Sixtieth street and Princeton avenue.

PURVES & BROCKWAY, 215 Fifth avenue, Chicago, are to install a steam heating plant in the residence of C. M. Bickford, Rogers Park, Ill.

JACOB G. WEBER, 244 North Clark street, Chicago, has the contract for the plumbing, gas fitting and sewerage in the flat building of Frank Rose, Oakdale avenue.

ALBERT A. CRYER & Co., 85 Centre street, New York, are installing two Richmond sectional boilers with 1600 feet of direct and 1500 feet of indirect radiation in the residence of J. A. Minott, at Orange, N. J., and intend to make this a model heating plant.

THE SCHOOL BOARD of Pittston, Pa., have awarded the contract for heating the Butler Hill School to John Scrimgeour for $800, and for heating High School No. 3 to Gorman & English for $867.

THE RETAIL STORE.

Round Loaf Baking Pan.

The accompanying cuts represent a round loaf baking pan, offered by Silver & Co., 304–310 Hewes street, Brooklyn, and 20 Warren street, New York. The pan is covered, and is designed to bake two round loaves of bread, 12 inches long and 4½ inches in diameter. It is stated that by the use of the pan bread will be baked evenly all through, that it will have a brown crust formed all over the surface, and that the bread will not crumble or break apart. The point is made that the bread, besides being pleasing in appearance, is baked right for making sandwiches, egg toast, Italian fritters, &c. The pan is made in Tin, X quality and Luster steel quality, in one size.

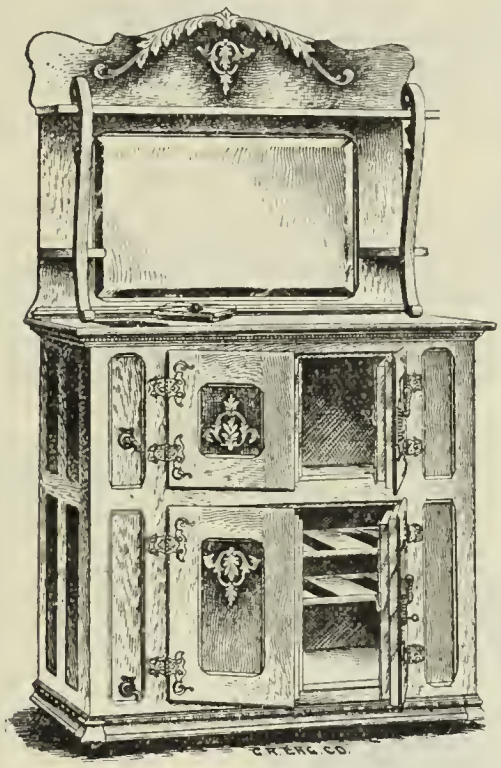


Fig. 1.—Round Loaf Baking Pan.

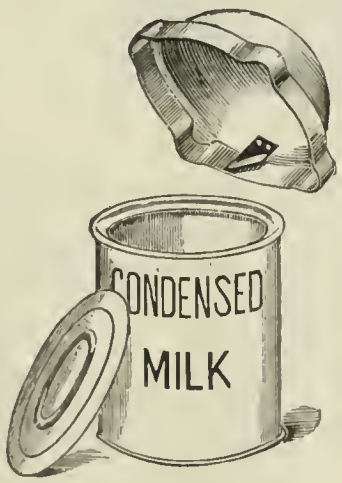
Fig. 2.—Round Loaf Baking Pan Open.

Dining Room Refrigerator.



An illustration is presented herewith of a refrigerator of new design, intended specially for dining room use, which has been brought out by the Grand Rapids Refrigerator Company of Grand Rapids, Mich. This refrigerator is elegantly carved and has a porcelain lined water cooler for drinking water, which opens on the top of the sideboard. As it has no connection with the interior of the refrigerator, the drinking water cannot be tainted by the smell of the food, but is always pure and cold. Another porcelain lined tank is placed in the provision chamber to receive the meltings from the ice. This avoids the using of a waste pan and furnishes soft water at any time through the faucet. The refrigerator is further supplied with all the special features which have made the Leonard cleanable refrigerators so popular. It is made in solid oak, highly polished, in three sizes, namely, Nos. 32½, 33½ and 34½. The last named size is 44 inches wide, 22½ inches deep and 76½ inches high.

Dining Room Refrigerator.

Eclipse Can Opener and Cover.

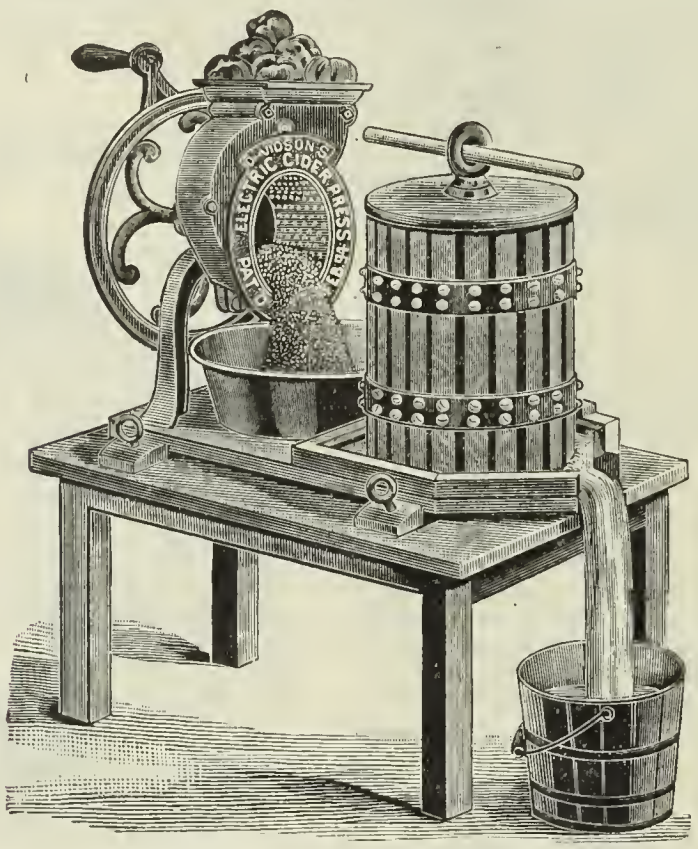
Brooklyn Novelty Company, 1055 Madison street, Brooklyn, are placing on the market the Eclipse can opener and cover, for removing the tops of condensed milk cans, as here shown.

Eclipse Can Opener and Cover.

It is then utilized as a cover until the contents have been used. The device is struck up from sheet brass and then nickled. On the inside of the dome is securely riveted a tool steel cutter, which is forced through the thin top of the can. The opener is then revolved until the top is cut out, the four projections in the run giving sufficient purchase or hold to do this. John T. Ryan, 96 Chambers street, New York, is the selling agent in this city.

Dietz Tubular Mill Lantern.

The accompanying illustration represents a tubular mill lantern being introduced by R. E. Dietz Company, 60 Laight street, New York. The burner is locked in place by two positive locks on the globe frame, which work automatically. In addition to this a padlock may be used to lock the globe frame to the guard frame, thus preventing the watchman lifting the globe to light his pipe, or for other purposes. The guard has the company's wind break to prevent access to the flame over the top of the globe. The guard, it is stated, is extra strong, well made, and that it is locked in position by an automatic spring. It is explained that the base of the lantern is given extra strength, and that it is locked permanently to the frame by the use of side braces, holding them firmly together, independent of solder, a feature, it is remarked, peculiar to these lanterns. The manufacturers claim that the lantern is substantially made in every respect; that the solid drawn retinned oil fount holds 1¼ pints of oil; that the lantern will burn 19 hours without refilling; that the combustion is perfect; that it burns with a clear white flame, giving a brilliant light, and that the oil never heats.



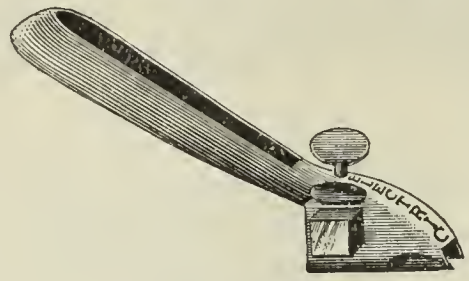
Dietz Tubular Mill Lantern.

THE FIRM of Buell & Farr, Earlsville, N. Y., was dissolved by mutual consent December 10. After that date F. C.

Buell took the hardware department and L. W. Farr the shop at the same place.

Davidson's Electric Cider Press.

O. E. Davidson & Co., Nashville, Tenn., are introducing a cider press, as here shown. The cutter is made of tinned steel, which, it is stated, will not wear except from rust, and will not rust if cleaned and kept in a dry place, while the board and crate are of well seasoned hardwood. The castings are of gray iron covered with water proof varnish to prevent rust, and the other metal parts are of wrought iron. It is explained that the press cuts and peels the apples, separating the good from the bad; a feature, it is remarked, that is not essential in making cider, but in preparing fruit for cooking purposes is very convenient. It is further explained that the danger of the cider becoming blackened by metal rollers and hoppers is obviated by the construction of the cutter, which carries off the cut apple before it touches any part of the hopper or other metal from which it might be stained. It is pointed out that as the press is small and convenient to carry, it is not likely to be left in the orchard to rust or to rot, as may be the case with larger presses. The manufacturers state that the press is small, light, strong and



Davidson's Electric Cider Press.

low in price, and that while not designed to make cider for wholesale or in large quantities, it will be found sufficiently large for family use and well adapted to that purpose.

B. & W. Skate Sharpener.

George M. Matteson, 111 Duane street, New York, as sole selling agent for Banker & White, is introducing the skate sharpener herewith shown. The sharpener is 4½ inches long, made of malleable iron, full nickel plated, with a square file held in place by a thumb screw. It is explained that the principle upon which the sharpener works is that of draw filing, and that by its use the dullest pair of skates can be sharpened in five minutes by any child old enough to skate. In use the side of the sharpener forms a right angle with the file, to make it impossible to file anything but a true plane on

B. & W. Skate Sharpener.

the skate, or to round the edges. The point is made that as the file wears it can be moved its full length on four sides, thus giving a large amount of filing surface.

MEMORANDA.

George B. Blizard, 108-110 Marion street, Philadelphia, distributes a very pretty calendar to his friends and customers. The illustration is a domestic scene from bird life, printed in colors. Mr. Blizard repairs and installs heaters and ranges, besides doing tin and sheet metal work of all kinds.

"The Jewett refrigerators, class 'A A' Special," is the title of a very handsome publication for which we are indebted to the John C. Jewett Mfg. Company, Buffalo, N. Y. It is a pamphlet 10½ x 8 inches, containing 55 pages and bound in a rough paper with the title in raised red letters. In the beginning is a brief account of the Jewett refrigerators, telling of their different styles and of their merits. Then follow 50 pages containing cuts of a great variety of styles of the Jewett "A A" refrigerators. The cuts are made from artistic sketches and each refrigerator is illustrated with a perspective view, plan and a cross section and often other views, such as transverse sections and different elevations. For the regular stock refrigerators Class A, the trade are referred to the company's annual illustrated catalogue or small refrigerator book. This second publication shows the latter style in various forms, the class of illustrations there likewise being artistic drawings, and in connection with the engravings are given price-lists and dimensions and particulars of each refrigerator.

Stover Mfg. Company, Freeport, Ill., are offering a cover lifter which is referred to as being made of the best quality of gray iron and Bessemer steel, with a spiral coil handle to render the lifter always cool. The manufacturers claim for it every advantage of the more expensive lifters, and also special advantages in its construction which enable them to sell at much lower prices than other lifters of the same class. They are finished in copper and nickel plate, and are packed one dozen in a pasteboard box, and one gross in a case.

The Wagner Mfg. Company of Sidney, Ohio, makers of the Wagner cast iron hollow ware and cast aluminum ware, are distributing to their friends a very neat calendar for the year 1895. The central feature of the design represents a healthy looking small boy who has lost a shoe and is fast losing his socks, standing upon an overturned wash pan and holding in his extended left hand a Wagner kettle, while a yellow cat occupies a conspicuous place in the background. The leaves forming the calendar proper are attached to the lower right hand corner of the card. In addition to the figures for the days of the week and month there is also a yearly calendar and an indication of the various phases of the moon. Advertising matter extends across the top of the card, while in the left hand corner is a *fac-simile* of the company's trade mark.

The Geuder & Paeschke Mfg. Company, manufacturers of tinware, &c., Milwaukee, Wis., report that they are making preparations for a vigorous campaign in 1895. The tariff agitation having been practically settled for the next few years at least, they believe that business men generally will be justified in expecting a conservative increase on sales, and that in consequence there will be much heavier demands made on manufacturers than have been experienced for some time. The Geuder & Paeschke Mfg. Company, who are in position to give prompt attention to all orders intrusted to them, extend a cordial invitation to the trade at large to avail themselves of their facilities whenever in need of goods in their line.

H. W. Gazlay, 138 Groton avenue, Cortland, N. Y., distributes circulars illustrating and briefly describing the Model milk cooler and aerator of his manufacture. The rapidity with which the device will cool milk and aerate it are alluded to in the account, as well as the advantageous features of the apparatus. The Model cooler is made of IXX tin plate, with galvanized iron bottom. The circular presents letters from many sources testifying to the merits of the cooler.

A calendar for the new year, for which we are indebted to D. H. Cassel, East Bucyrus street, Crestline, Ohio, is one of the serviceable sort that will be appreciated by the trade. It is mounted on a green back, and the sheets of the calendar are large enough to present the days in big type that can be plainly read at a distance. The moon's phases are a feature of the calendar. Mr. Cassel is a dealer in hardware and stoves and a manufacturer of copper, tin and sheet iron ware.

STOVE TRADE NOTES.

Ohio and Indiana Stove Trade.

A few manufacturers throughout Ohio and Indiana are still in the throes of stock-taking, but most of them have completed, or nearly so, their balance sheets, showing the result of the year's business. Returns from Indiana are uniformly encouraging, and reports throughout Ohio, while varying in some respects, may be taken as a fair indication that there has been decided improvement throughout the year, although some foundries find they have fallen below the standard of '92, and in some instances even below the record of '93. When it is remembered that most of the conditions having an influence upon the market were discouraging to the utmost during the first half of the year, it is not surprising that the past six months have not wholly made up the deficiency to the majority; yet in not a few instances has this been the case, so that, taken all in all, the outlook is one of confidence, although it is yet too early, nor is it the season, for reports of increased sales.

One prominent manufacturer, summing up the situation from his own experience and from information gathered from others, reports that there has been an average shrinkage of sales of about 20 per cent. compared with 1893. Profits have suffered, from his standpoint, first from reduced sales and increased cost of manufacture due to decreased production, and second because of the higher cost of production arising from the improved and higher standard necessary to maintain by the general demand and through active competition, to cover which there has not been a corresponding increase in the selling price. But while prices have not advanced, they have remained steady. It would seem that the lower prices prevailing for raw material may have contributed something toward this end, thus benefiting the foundries, and, in some instances, at least, a lower scale of wages has prevailed. Other dealers, however, report that balance sheets show them that sales were about 8 per cent. more during 1894 than in 1892, and 20 per cent. more than in 1893, and one manufacturer writes that their sales during 1894 were almost double those of 1893.

Many foundries which closed down for the holidays and stock-taking have resumed, some with full heats and full handed.

There is a fair run of small orders throughout, but no large contracts, and we do not hear that large stocks of any kind were carried over, but this is due probably to the conservatism which characterized trade throughout the entire year.

The prospects for '95 seem to be regarded as good, and manufacturers urge that a spirit of conciliation be exercised by all to the end that rate cutting may not disturb the outlook.

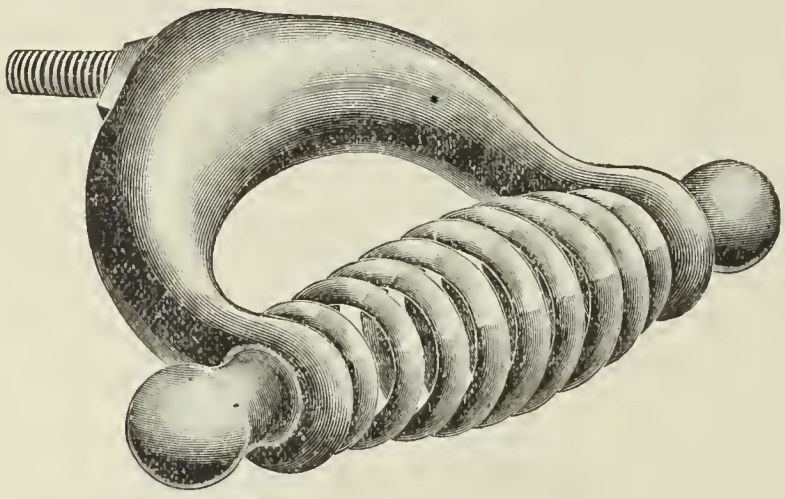
James S. Bailey.

James S. Bailey, president of the Tuttle & Bailey Mfg. Company, New York, Chicago and Boston, died on Sunday, January 6, at his home, 176 Harrison street, Brooklyn, of cerebral thrombosis, after an illness of about six weeks. He was born at Lebanon, Conn., December 9, 1817, and was descended from an English family who settled in Newburyport, Mass., in 1638. Mr. Bailey went in 1836 to New Haven, where he was engaged in business for a number of years. In 1847 he came to New York City, and in the following year went into partnership with C. F. Tuttle in the manufacture of registers, ventilators, &c. In 1866 the concern was incorporated as the Tuttle & Bailey Mfg. Company, well known as one of the leading houses in their line in this country. Mr. Bailey was president of the company from the time of their formation. He was a man of marked business capacity and very high character, and was noted among his associates for wisdom in council and for his absolute integrity. In private life his amiability of disposition and sympathetic nature endeared him to a wide circle of personal friends. He was warmly in sympathy with every movement for the amelioration of humanity, and was interested in a number of philanthropic and religious undertakings, in connection with which his loss will be severely felt. He was a member of the Chamber of Commerce of New York City, was a trustee of the South Brooklyn Savings Institution and had been for a long period associated with the Central Congregational Church of Brooklyn, of the Board of Trustees of which he was for many years the president. Mr. Bailey was married in 1843 to Augusta C. Trowbridge, daughter of Capt. Roswell Trowbridge of New Haven, Conn. The celebration of their golden wedding, on July 25, 1893, was attended by a large gathering of their children and grandchildren. Six children were born to them, of whom five are still living, two sons being connected with the Tuttle & Bailey Mfg. Company. The funeral was held on Wednesday and attended by a large circle of personal friends and business associates. The interment took place at New Haven, Conn., the following day.

E. D. PURVES will continue to look after the interests of Southard, Robertson & Co., 257 Water street, New York, in Pennsylvania, Delaware, New Jersey and the South during 1895. Their line of stoves and ranges have become leaders with many dealers in the territory mentioned.

The Coldwater Oil Stove Company.

Important improvements are now being made at Coldwater, Mich., in the plant of the Coldwater Oil Stove Company. This company began business in a modest way not long since, under the very efficient management of B. S. Tibbits. The plant known locally as the Titus Foundry was utilized for manufacturing, but the business has grown so rapidly that larger facilities have for some time been urgently needed. It has therefore been decided to erect new buildings, which are to be specially adapted to the purpose, and will be placed in a more convenient locality. One of these buildings will be 60 x 200 and the other will be 60 x 66 feet. They will be pushed to completion as rapidly as possible, and will be equipped with the most improved machinery and latest appliances for manufacturing every part of the different kinds of stoves which the company will place on the market.



The company have thus far made and won their reputation on the All Right and Sunbeam oil heaters, which have found their way all over the United States. The success thus achieved has inspired Mr. Tibbits to extend the business so as to embrace other related lines. When the new plant is finished he will also make oil cooking stoves of several styles, somewhat on the plan of gasoline stoves, with two or three or more burners, but consuming oil instead of gasoline. He will further make a wood burning stove and range to meet the demand for an article of this character which will combine low cost with beauty, utility and economy of fuel. It is pleasant to note the evidence of prosperity which is thus presented.

HARTER & COSLEY, Troy, Ohio, who are agents for the Charter Oak stoves and ranges manufactured by the Excelsior Mfg. Company, St. Louis, are at present congratulating themselves on the outcome of a contest which was recently inaugurated by them. Early in December Harter & Cosley offered valuable prizes to the boys and girls of Troy who would enter a spelling contest. The words selected for the boys were "Harter & Cosley, Hardware," and the boy sending in the largest list of correctly spelled words composed of letters used in the above would receive a tricycle, while the sender of the second largest list would receive either a pair of skates or a sled. The girls' prizes consisted of a miniature Charter Oak stove as the first prize, and a pair of skates as the second prize, while the words selected for them to compose from were "Charter Oak Stoves." The contest created interest for weeks preceding Christmas, and on that day the prizes were delivered. On Christmas afternoon the store of Harter & Cosley was crowded clean out to the pavement. A band of music was present and the distribution of the prizes began. Miss Amy Allen secured the first girls' prize with 1350 words, while Miss Harriet Mitch was a close second with 1339 words. The boys' prizes were secured

by J. Morris Coombs with 3762 words, and Glen McConnell won the second prize with 3745 words. There were in all 206 competitors, and the enterprising merchants distributed to each and every one a bag containing oranges, candy and nuts, and a pearl handled pocket knife. While the labor incident to a contest of this kind is very considerable, yet the results obtained in this case were such that the labor expended was more than repaid. The Excelsior Mfg. Company are to be congratulated on having such wideawake and enterprising agents.

New Alaska Stove Door Handles.

The Troy Nickel Works of Troy, N. Y., have recently added to their already extensive assortment of Alaska goods a number of new designs of handles for this year's trade. We present in the accompanying illustrations two of the many styles which the company are offering, one being severely plain in its treatment, while the other represents a form more elaborate in construction. The handles are made of cast iron, with that portion that comes in contact with the hand constructed of Bessemer steel wire, the whole being heavily nickel plated. The merit of Alaska goods is that they are always cool to the touch and the housewife or domestic runs no danger of burning her hands when opening a stove door fitted with one of these handles. The assortment which the Troy Nickel Works are offering the trade this year is a varied one and includes designs adapted to meet all reasonable requirements.

New Alaska Stove Door Handles.—Fig. 1.—General View of a Plain Handle.

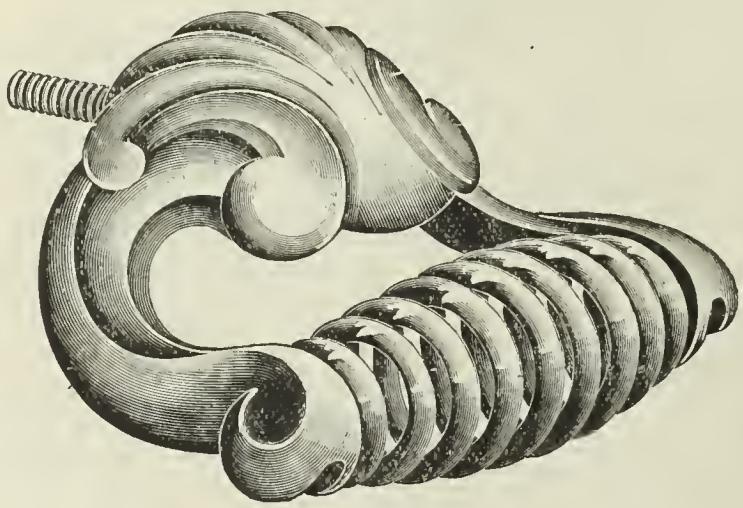


Fig. 2.—Handle of More Elaborate Design.

ODD PLATES.

THE BLOOM ROTARY OVEN COMPANY have been incorporated at Burlington, Mo., by John Cook, A. Sciel and S. Black, with a capital stock of $21,000.

HOLLY, MASON, MARKS & Co. of Spokane, Wash., have begun the manufacture of a sheet iron heater named the Queen. A local paper notes the remarkable fact that out of the first output of the factory an order was filled from New Bedford, Mass., and another from San Francisco, Cal.

THE MICHIGAN VAPOR STOVE COMPANY of Grand Rapids, Mich., are now settled in their new home. The work of removing from the old location required several weeks' time. The new building is located at 14 to 18 Mill street, with the rear on the bank of the Grand River. It is a brick four-story and basement structure, with dimensions of 50 x 100 feet, and an addition in the rear 16 x 100 feet. A separate building for japanning, 36 x 46 feet, has been erected at a distance of 25 feet from the main building. The basement of the main building is used as a press room, containing four presses, the largest of which is capable of taking a 21 x 39 inch stove top and then allowing 2 inches leeway. This machine was built by the E. W. Bliss Company and weighs 12 tons. This room also contains a planer built by the G. A. Gray Company of Cincinnati, 36 inches by 8 feet. The engine and boiler room are also in the basement. Power is supplied by a 90 horse-power engine and a 90 horse-power water wheel. On the first floor are the office and shipping room, tool room and machine room. The second floor is used as an assembling and mounting room, pattern and crating room and also has the testing room, which is 16 x 24 feet and is lined with sheet iron. The third and fourth floors are devoted to storage purposes, being used for storing stoves ready for the market. The company are now making 27 styles of stoves, including a full line of juniors, both high and low, and with single generators and individual burners. A notice of their line of stoves would not be complete without a reference to the jet cone burner, which is their distinctive specialty and is a feature of all the higher grade stoves. The company are not a corporation but a co partnership, of which F. A. Stone is manager and B. P. Kenyon superintendent. With a fine equipment and ample capital, this company will be an important factor in the vapor stove trade.

H. N. REYNOLDS, secretary and treasurer of the Craig Reynolds Foundry Company, Dayton, Ohio, was a recent visitor at the office of *The Metal Worker*, and is exceedingly enthusiastic over the outlook for the sale of the Triumph line of heaters and furnaces this company are producing the present year. Mr. Reynolds is an indefatigable worker and is largely responsible for the rapidity with which this company's productions have become so well and favorably known.

THE PERRY STOVE COMPANY, 242 Water street, New York, are already making preparations for the summer trade. They have secured the agency for the sale of the Aurora gasoline goods, and will soon bring out two new lines of gas hot plates. A. J. Kirkland has been engaged by the company to visit the trade in New York City and on Long Island.

DAVID MILLAR has made an engagement with the Fuller & Warren Company of Troy, N. Y., to represent them in New York and vicinity. He will have an office at 236 Water street, and will visit the trade in the interests of the F. & W. stoves, ranges, furnaces and steam and hot water goods.

THE Craig Reynolds Foundry Company, Dayton, Ohio. manufacturers of the Triumph line of furnaces and heating apparatus, are rapidly extending their line of agencies; among the more recent being that of the Pittsburgh Heating & Supply Company, 100 Wood street. Pittsburgh, Pa. This concern have been reorganized with ample capital, and will have exclusive control of sales within a territory covering 100 miles radius from Pittsburgh. The home company now have in active operation over a dozen first-class agencies for the sale of their productions, and are highly gratified with the reception their goods have met, as is evidenced by the numerous testimonials received daily. Six styles and 32 sizes, from the cheapest to the highest grade, warm air furnaces are now being marketed by them; in addition to which they are producing two styles and ten sizes of combination heaters. A handsome catalogue full of valuable and practical information is now on the press, which will be ready for distribution February 1, 1895.

THE CHEAP FUEL PROBLEM for the fuelless prairies of the Northwest, says a Western paper, was settled by the Maker of the earth before humanity raised the question of a problem. There is now hardly a portion of the settled prairie country of the Northwest that is not blessed with an outcropping vein of

lignite coal, and where this fuel can be easily reached by rail or wagon road the farmers that were wont a few winters since to spend the cold season twisting marsh hay for fuel are now burning this lignite, and enjoying coal fires with less expense than many of the citizens of Eastern States. This winter farmers are hauling into Bismarck by wagon this coal, taken from exhaustless veins a few miles north of the city. They sell the coal in the city at $2.50 per ton, which they buy at the mine for 90 cents. This coal is sold at most of the Dakota cities at from $2 to $3 per ton. Two and a half tons are worth 1 ton of the best anthracite, which would cost from $8 to $11 per ton.

THE REPUTATION of the goods manufactured by the Portsmouth Stove & Range Company of Portsmouth, Ohio, is not confined to this country alone, but has spread abroad among foreign nations. The company have lately received a letter from Thalmyl, Switzerland, asking prices on their ranges delivered at Antwerp, and feel that after the goods are once introduced into that section of the world large sales will result.

DE HAVEN & COMPANY Limited, Pittsburgh, Pa., have brought out a new line of Cinderella Kitcheners which are reported as being an entirely new series of all cast iron ranges, and adapted for burning hard or soft coal or wood. The ranges are referred to as having embodied in their construction many new and desirable features. They are made with feet and skirting in lieu of the low closet, and they also have a full complement of high shelves and high closets. The reservoir is made of planished copper and holds 15 gallons of water.

THE LAURA NEVINS RANGE & HEATING COMPANY, Minneapolis, Minn., recently issued a very neat Christmas greeting in the shape of an oblong pamphlet dedicated to the "friends, admirers and patrons of the famous Laura Nevins ranges." The little pamphlet is presented with the compliments of J. H. Nevins and contains a history of the Laura Nevins ranges from their inception to the present time. A portion of the pamphlet is devoted to testimonial letters from some of those who have used the goods named.

A FEW DAYS AGO we received a cordial note from the Troy Nickel Works, Troy, N. Y., and after referring to the gratifying relations that have existed between us during the past year, they mention that they have taken the liberty of sending us a New Year's gift of a diamond pin. At least that is the way we read the letter, and we waited with not a little interest the coming of the present. A little package was duly received a day or two later, and was opened with no small degree of anticipation and curiosity. Exactly what this diamond pin was need not be told here. It was an article of considerable intrinsic value and was not a bit of paste or molded glass which we had expected to find. We cannot promise that every one will receive one of these gifts on application, but it would be worth while inquiring about them to merely satisfy one's curiosity.

F. V. KNAUSS of the Portsmouth Stove & Range Company, Portsmouth, Ohio, has been experimenting for some time past with a view to securing the complete combustion of fuel in a heating stove. The knowledge that no substance containing water can be heated beyond the temperature of the water within it, has been utilized by Mr. Knauss in making the parts of a heating stove exposed to the direct action of the fire hollow and keeping them filled with water. The water is constantly changed through a system of circulation and the arrangement is such that by means of radiators a number of rooms may be heated. The experiments were made with an old Denmark retort stove taken from the scrap pile, and the results are said to have been very satisfactory. We understand that Mr. Knauss has patented his invention and will apply it to the construction of heating stoves.

THE CENTRAL OILGAS STOVE COMPANY announce to their friends in the trade that a new catalogue for 1895 will be ready for distribution within a few weeks. The company have very carefully studied the requirements of the trade, and feel that the lines they will offer are complete in all respects. They will place on the market specialties in new goods which, by reason of their many attractive and desirable features, as well as the prices at which they will be offered, cannot fail to commend themselves to the attention of dealers generally. In addition to their popular Oilgas cook stoves containing improved burners for 1895, the company have something entirely new in the way of lamp stoves at special prices, and also sheet steel circular burner oil cook stoves.

H. WATERMAN, manager of the New York office, at 109 Beekman street, of the Cleveland Foundry Company, Cleveland, Ohio, has been in Philadelphia in the interest of their line of Puritan gas and oil heating and cooking stoves.

THE DIGHTON FURNACE COMPANY of North Dighton, Mass., are distributing with their compliments a very pretty calendar in the shape of a poster bound with metal strips, and provided with a metal eye for hanging it upon the wall. The design, which occupies the greater portion of the poster, consists of the picture of a beautiful child, the printing being in colors which harmonize much better than is usually the case with lithographs. Across the top of the poster is the name and address of the company, while at the bottom are 12 small leaves carrying a calendar for the months of the year. There is given in addition to the days of the week and month the various phases of the moon.

THE CALENDAR sent out by Roberts, Winner & Co., Quakertown, Pa., is an amusing card appropriate to the season. The decoration is an arctic scene with several polar bears skating about a field of ice. If the stoves, ranges and Alaska furnaces are suitable to the condition of the climate represented in the picture they are undoubtedly most efficient apparatus. The calendar proper is attached to sheets at one side of the card.

SINCE the Meyer Furnace Company of Peoria, Ill., purchased from the Weir Furnace Company of Des Moines, Iowa, the right to manufacture and sell the Weir soot and gas burning steel furnace in the State of Illinois, they have turned out 300 of these constructions in order to supply the demand from consumers in the State named. The Weir Furnace Company have lately completed arrangements with the Anshutz-Bradberry Company of Pittsburgh, Pa., whereby the latter concern will make the furnace and supply the trade in the States of Pennsylvania, Ohio and West Virginia. The Anshutz-Bradberry Company have about completed the patterns for the manufacture, and, we understand, will engage in the production on a large scale. They will call the heater the Tremont gas and soot consuming furnace, for which a large sale is expected. They state that as a starter they will place seven of them in the Eleventh Ward school house in Pittsburgh.

WE ARE INDEBTED to the Scranton Stove Works of Scranton, Pa., for a copy of the 1895 calendar which they are distributing with their compliments to friends in the trade. The 12 leaves for the calendar proper are attached to the lower portion of a piece of heavy cardboard, in the upper left hand corner of which is a bird's-eye view of the Dockash Stove Foundry. Another picture represents three lads, two of whom have dinner pails in their hands, while the third is holding aloft his miner's cap. From the humorous expression of their faces and their general attitude it is evident that they are posing before the camera. The boys are on their way to the coal breaker and mine represented in the background of the picture, and which is located to the right of the stove foundry shown in the upper left hand corner of the card. At the left of the picture is the statement that the Dockash Foundry was in continuous operation during the year 1894, and that "dealers securing the sale of Dockash stoves and ranges always lead the market in their respective towns." The printing of the pictures is in black, while the text is in red.

THE MARCH BROWNBACK STOVE COMPANY of Pottstown, Pa., issue an announcement relative to their heater department to the effect that in the Crown soft coal furnace the drum is self cleaning and all joints asbestos packed, the latter being water tight and therefore air tight. The construction is such that the products of combustion are made to come in contact with all parts of the radiator, thus giving a maximum radiation. The furnace has side draft, created by the fire pot being deeply ribbed on the inside. Attention is also invited to the Art Franklin grate, suitable for halls in dwellings, libraries, dining rooms, sitting rooms, bedrooms, &c. It is also arranged for heating rooms on the floor above. Circulars which the company have issued represent but a small portion of the many types of goods made, and the company suggest to dealers that if any part of them should not fully meet their requirements the company be advised in what respect the goods are wanting, so that they can forward circulars of other goods which will exactly meet their wishes.

JAMES DANIEL is one of the corps of salesmen who will advance the interests of the Acorn line of stoves and ranges for Rathbone, Sard & Co., Albany, N. Y., this year.

E. E. HORTON, one of the traveling salesmen of the Thatcher Furnace Company, 240 Water street, New York, has been making a few days' visit with the house previous to making one of his regular trips in the interest of the Thatcher furnaces and the Champion steam and hot water apparatus.

THE PECK-WILLIAMSON HEATING & VENTILATING COMPANY, with home office and factory at Cincinnati, Ohio, and branches in Chicago, Pittsburgh, Dayton and St. Louis, have been distributing to their friends in the trade

copies of what is known as Catalogue B. It is a volume of 80 pages, printed on good paper and neatly bound in heavy paper covers, embellished with embossed side title in old gold. The text is composed, for the most part, of testimonial letters from those who have used the company's goods. There are many illustrations, consisting of photo reproductions of buildings heated and ventilated by the company's system, the structures including public as well as private buildings, churches, &c. The latter part of the volume contains illustrations of the company's furnaces, together with descriptive particulars.

W. L. MERSFELDER, proprietor of the Cincinnati Pattern Works, Front and Lawrence streets, Cincinnati, Ohio, is distributing a very neat folder, neatly printed in colors and carrying on the front cover a handsome design embossed in old gold, bronze, red, white and green. In the upper left hand corner is the inscription, "Season 1895," and in the lower right hand corner, "A Short Tale Quickly Told." The inside pages of the folder are devoted to text relating to patterns made by the concern named. Attention is called to the artistic design of patterns which have been turned out for a number of years by means of a plant equipped with modern machinery and employing skilled labor. Reference is also made to the fact that they manufacture wood and iron patterns as well as follow boards, and furnish to order for approval designs and drawings. The folder is arranged with a silken cord with a pink tassel.

FLOYD, WELLS & Co. of Royersford, Pa., are the assignees of a patent granted last month to Isaac Brooke of Pottstown, Pa., for a hot air attachment for stoves. This attachment consists of a jacket which incloses the fire pot of the stove in such a way as to leave an air chamber between it and the fire pot. There is a depending portion of the jacket which, with the wall of the ash pit, forms an air supply nozzle. The lower portion of the jacket closes on the ash pit or base, while the upper portion is separated from the rim in such a way as to form a discharging passage. The arrangement of parts is such that air is directed to the exterior of the fire pot and then discharged from the air chamber in a highly heated condition.

THE DIRECTORS of the Central Stove Works of Lebanon, Pa., held a meeting last week for the purpose of arranging a programme for the new year. They decided, among other things, to increase the productive capacity of their plant in order to meet the rapidly growing demand for their goods.

THE TROY NICKEL WORKS of Troy, N. Y., are favoring their friends with neat little circulars calling attention to Alaska goods, which they are manufacturing in almost endless variety. Attention is specially directed to the Alaska tack hammer made of solid steel and full nickel plated, Alaska pokers, lifters, shovels and fire sets, and also to the Troy stove pipe damper.

THE PHILLIPS & CLARK STOVE COMPANY of Geneva and Troy, N. Y., are furnishing their friends in the trade with a calendar, diary and memorandum combined, it being of the same general style as that which they have issued for several years past. The card is in the shape of an easel for desk use, the lower portion carrying yearly calendars for 1895 and 1896. Over these calendars is fastened what is known as the "Daily Reminder," copyrighted by the Matthews-Northrup Company, Buffalo, N. Y. This, as stated above, is a calendar, diary and memorandum combined, its special use being to remind one of things to be done each day and serve the place of an office diary. In using it all the leaves but the last on the left side should be folded back to the right, and one leaf turned over every two weeks thereafter. At the end of the year the "Daily Reminder" can be preserved as a record of the engagements of the year. A cord is so arranged in connection with the card as to hold the diary open at any page desired.

Russel Wheeler.

Russel Wheeler, one of the best known citizens of Utica, N. Y., died at his home in that city on January 5, after a brief illness. He was born at Rome, N. Y., August 7, 1820. He obtained an education in the district school, and at the age of 18 years entered John Mair's hardware store, remaining four years. In 1842 he became bookkeeper for Joel C. Bailey, who had purchased the Dexter Foundry in Utica. He was admitted as partner two years later, the firm being Bailey, Wheeler & Co. The concern increased the quantity and quality of their products and won a high reputation. The first coal cooking stove manufactured west of Albany, N. Y., was made in the firm's factory on Columbia street. During the 21 years of the firm's continuance they secured numerous patents for improvements in the construction of stoves and laid the foundation for a large and lucrative business. In 1855 Mr. Wheeler bought out the senior partner, and ten years later secured the interest of S. Alonzo Bailey. After 12 years he admitted to partnership his son, Frank E. Wheeler. Two years later a share of the business was secured by Francis Kernan, Jr. The partnership continued until January 1, 1890, when Mr. Wheeler and his son purchased Mr. Kernan's interest and made the firm Russel Wheeler & Son. Mr. Wheeler had been identified with numerous local interests. In 1849-50 he served as Alderman. He was a director of the Oneida National Bank and the Savings Bank of Utica. For many years he was vice-president of the Utica City National Bank. He was a director in the Utica Steam Cotton Mills and Willovale Bleaching Works, and had been a director of the old Utica & Black River Railroad Company. He had served Colgate University many years as a member of its Board of Trustees. He was an extensive traveler and had made frequent trips through the West, where he had large property interests, and also abroad. He was twice married, and leaves a widow and son.

H. R. Ives & Co., Montreal, Canada, have lately completed successfully a rather remarkable piece of foundry work. They have made 440 large sections of pipe, 10 feet in diameter and 5 feet long, weighing between three and four tons each. Out of this large number there were only 17 defective ones from any cause whatever. These rings or pipe sections were used for culverts underneath the new Soulanges Canal, allowing two rivers to run beneath the canal.

The recent severe cold in this section provided a large ice crop on the Hudson and other rivers.

TRADE REPORT.

The Iron Market.

Pig Iron.—As ragards to the New York market, makers of Standard Pennsylvania brands report a heavier movement, particularly in the lower grades. Some of the Pipe founders and puddling mills have contracted for considerable quantities. There is more inquiry for Foundry grades for delivery this year, and some transactions of this character have been closed. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

Philadelphia advices indicate that Foundry Irons are steady at last week's prices, but very inactive. Local furnaces are well sold up, and as freights are too high to permit of other Irons being sent there at less than quoted rates, new business is comparatively unimportant. Deliveries on old contracts are being taken with satisfactory promptness, so that furnaces are not accumulating stock to any great extent, but the question of prices for later deliveries is still to be settled. Ssles have been on a fairly liberal scale at about the old figures. General quotations for Philadelphia and equivalent points are about as follows:

Standard No. 1 Foundry X	$12.50	@	$13.00
Standard No. 2 FoundryX	11.50	@	11.75
No. 2 Plain	10.75	@	11.00
No. 1 Soft	11.50	@	11.75
No. 2 Soft	10.75	@	11.00

The trade in Local Coke Iron in the Chicago market shows no improvement over that reported last week. The demand is of moderate character, and inquiries have not increased. Sellers of Southern Coke Iron report a somewhat better inquiry in their line, but sales have been confined to small quantities. Lake Superior Charcoal is quiet. Quotations are as follows, for cash:

Lake Superior Charcoal	$13.00	@	$14.00
Local Coke Foundry, No. 1.	10.25	@	10.50
Local Coke Foundry. No. 2.	9.75	@	10.00
Local Coke Foundry No. 3.	9.50	@	9.75
Local Scotch	10.50	@	11.00
Ohio Strong Softeners No. 1	12.50	@	13.00
Southern Silvery, No. 1	11.50	@	11.75
Southern Silvery, No. 2	11.25	@	11.50
Southern Coke, No. 2	10.00	@	10.50
Southern Coke, No. 3	9.75	@	10.25
Southern, No. 1, Soft	10.00	@	10.50
Southern, No. 2, Soft	9.75	@	10.25
Alabama Car Wheel	17.50	@	18.00
Jackson County Silvery	15.50	@	16.00
Other Ohio Silvery	14.25	@	14.50

The past week in the Pittsburgh Pig Iron market is reported as having been extremely quiet, sales being nearly altogether for small lots. In Foundry Irons little is doing and prices are weak and lower. For delivery during the next three months quotations are given as follows for cash:

No. 1 Foundry	$10.50	@	$10.65
No. 2 Foundry	10.00	@	10.25

Sales of Pig Iron are reported as having increased rather than otherwise in the Cincinnati district, that is, the run of small orders has aggregated a larger tonnage, and one or two round lots have also been sold, but prices have been so low that the profits have been below the average of ordinary times. Pipe works continue to be the largest melters of Pig Iron in the district. Quotations are given as follows:

Southern Coke, No. 1	$9.75	@	$10.00
Southern Coke, No. 2	9.00	@	9.25
Southern Coke, No. 3	8.50	@	8.75
Ohio Soft Stone Coal, No. 1	14.50	@	15.00
Ohio Soft Stone Coal, No. 2	14.00	@	14.50
Lake Superior Coke, No. 1	11.75	@	12.25
Lake Superior Coke, No. 2	10.75	@	11.50
Hanging Rock Charcoal, No. 1	16.00	@	16.50
Hanging Rock Charcoal, No. 2	15.50	@	16.00
Tennessee Charcoal, No. 1	13.00	@	13.50
Tennessee Charcoal, No. 2	12.00	@	12.50
Bessemer	11.65	@	12.00
Standard Southern Car Wheel	15.75	@	16.75
Lake Superior Car Wheel and Malleable	14.25	@	14.75

A number of inquiries for Pig Iron are noted in the St. Louis market, which will, it is thought, lead to business later on. No. 2 Foundry is quoted at $7, f.o.b cars Birmingham, and is being firmly held at this figure. It is intimated that considerable No. 2 Foundry Iron has been sold short, and that a determined effort will be made to force the price down. Whether this can be accomplished of course remains to be seen. Sales during the week have been confined largely to carload orders for immediate delivery, We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.50	@	$10.75
Southern Coke, No. 2 Foundry	9.75	@	10.00
Southern Coke, No. 3 Foundry	9.25	@	9.50

Metal Market.

Pig Tin.—In a speculative way there has been quite a large turnover the past week. Sales and resales publicly announced in the wholesale market represent a total of about 585 tons, and deals representing half as much more were put through quietly. The movement of prices was narrow, particularly so when the volume of trading is considered. Together with the fact that deliveries to jobbers and consumers have been heavy, and that stocks are still unusually large on both sides of the Atlantic, this leads to the impression that the market is being carefully nursed by a master hand at the business. Some authorities claim, however, that a large "short" interest exists and has more or less influence upon the market, particularly for early deliveries. Prices for small parcels from store are rather easier, Straits Pig being quoted at 15¢ @ 15½¢, Banca at 16¢ @ 16½¢, and Straits in bars at 16¢ @ 16½¢ per lb.

Copper.—The market for Ingot is without important change. In fact, about the only feature is that the offerings of outside lots of Lake at a fraction under the lowest figures of last week have increased somewhat. The large companies have, however, been filling ordinary orders at the old price, which they do not appear to be anxious to cut. Jobbing business has been only fair, consumers still pursuing a conservative line in their purchases. Prices for small lots are unchanged from last week's quotations.

Sheet Copper.—A moderate business is reported, varying in none of its aspects from the conditions noted in last week's report. Prices for small lots from store are firm on a net basis of 15¢ ℔ lb.

Pig Lead.—Dealings have been on a somewhat larger scale, yet not up to what might reasonably be looked for, considering the narrow lines upon which buyers have operated for a month or six weeks past. Prices have remained stationary, American Pig in small lots being quoted at 3⅜¢ @ 3½¢ ℔ lb.

Solder.—Only a moderate demand is noted, with prices somewhat lower, owing to the decline in Pig Tin. Jobbers ask for ½ and ½ guaranteed, 11¢, and for No. 1, 9¢ ℔ lb.

Spelter.—No change has taken place here. Orders have been as few and as small as they were last month, and inquiries have afforded no indication of mored is position on the partof consumers to buy. The offering is not heavy, however, and prices remain quite steady. Good Western in small parcels from store rules at 4¢ @ 4¼¢ per pound.

Tin Plate.—Some increase in sales of fair sized lots from store has taken place during the week, and the aggregate of small sales has been rather larger than that of last week, while a little more interest is manifested in forward shipments, owing probably to the prospective curtailment of production on the other side, from the closing down of works on account of the wage dispute. Yet the market lacks real animation, and the volume of business lags behind the average for this season of the year. Canners and other large consumers still postpone making their forward contracts, and buyers in general are inclined to adhere to the conservative policy they have pursued for so long. The recent severe weather, too, has operated adversely on the demand in this section of the country. Prices are practically unchanged, but are inclined to weakness.

A London cable dispatch of January 9 to *The Iron Age* reports as follows in regard to the British Tin Plate market: Tin Plate market quiet, but values steady. Business confined chiefly to quick deliveries. Buyers lack confidence and prefer waiting developments. Wasters have been in better demand for Eastern account. The quotations, f.o.b. Swansea, are as follows:

Bessemer Cokes, IC 14 x 20	@ 9/6
Siemens Cokes, IC 14 x 20	9/9 @ 10/
J. B. Steel Cokes, IC 14 x 20	
Ternes, 20 x 28	18/6 @ 21/
Charcoals, IC 14 x 20	10/6 @ 12/6

G. Moser & Sons, Die makers and manufacturers of Tin Tags and Impression Plates, 225 West Second street, Cincinnati, Ohio, distribute to their friends in the trade a handsome calendar tastefully decorated in colors.

L. E. Wagar & Son, West Sand Lake, N. Y., were dissolved by the retirement of the senior member of the firm. His interest has been purchased by his son, A. U. Wagar, who continues the business in stoves, ranges, tin, steel and slate roofing.

CONDITION OF THE

Hardware Trade.

IT IS EARLY as yet to look for improvement in business, as the trade have not much more than closed the accounts of the past year and are completing their preparations for the coming season, travelers beginning to go out, and merchants, after the annual inventory, are making out their orders for goods necessary to complete their assortments. As these in many cases were permitted to run down to an abnormally low point, an opportunity is afforded them of purchasing freely, but this they seem as yet indisposed to do. In the matter of prices the market continues without especial strength, and while there are comparatively few announced changes there are indications of weakness and slight concessions in the prices of a good many goods. Reference is, however, often made to prices as so low that they are not likely to decline further, and that the termination of the downward tendency must come sooner or later. Goods are certainly cheap enough, and the indications of improvement in certain lines are regarded with satisfaction by all concerned.

Advices from Chicago. — As intimated in a previous report, the salesmen connected with the Chicago Hardware houses made a very short stay during their home visit this year. With few exceptions they are all now on the road and are again hard at work. The orders for the first week of the year were very much better than that of last year, showing increased buying in almost every line in which business is done at this season. The outlook is extremely encouraging, as prospects are improving even in districts which suffered most from short crops or low price of farm products.

Notes on Prices.

Wire Nails.—The Wire Nail trade is in hardly as good condition as it has been for the past two or three weeks, there being some indication of increasing irregularity in prices. The manufacturers report a good deal of inquiry, but the volume of business is not exceptionally heavy. Small lots from store in New York are held at about $1.15.

Advices from Chicago.—Manufacturers report a light inquiry. Distributers appear to be pretty well supplied with Nails to cover their requirements for some time into the future and are not disposed to add to their stocks at present. Small lots from stock stand at $1.10 and for direct shipment from factory at $1.05, with mixed carloads at $1.

Cut Nails.—There is little business doing, but some inquiries are reported and the trade evidently are disposed to purchase only as Nails are needed. The tone of the market is unchanged and quotations are apparently slightly shaded when necessary, and especially when the assortment is attractive. Small lots from store are quoted at 90 to 95 cents.

Advices from Chicago.— No special feature has developed since last report. Manufacturers are receiving small orders only, which have aggregated only a moderate business. Prices are maintained at $1 for small lots from stock.

Barb Wire.—The Barb Wire market continues to be characterized by a moderate demand, but the year opens with many orders on manufacturers' books and an encouraging outlook as to the volume of trade in 1895. Notwithstanding this satisfactory condition, as far as the demand is concerned, the tone of the market is rather weak and slightly lower prices are obtainable than have recently prevailed.

Advices from Chicago.—Immediate business is light, but manufacturers now report that they are well supplied with orders for some time to come and are therefore not soliciting business so actively. Quotations are still $2 for Galvanized and $1.65 for Painted in small lots for direct shipment from factory and $2.10 and $1.75 for small lots shipped from stock.

Tinware.—The market for Tinware, pieced and stamped, is in a very unsatisfactory condition and prices are low and irregular. List prices are to a large extent dispensed with and sales made at net figures. Competition between the manufacturers is decidedly active, and altogether the situation is far from satisfactory. There have been some rumors in regard to an understanding between the manufacturers by which more regularity could be imparted to the market in this line, but nothing evidently has as yet been accomplished in this direction. Under date of January 2, Lalance & Grosjean Mfg. Company, New York, announce the following changes in list prices as given in their catalogue, January, 1894:

Cocoa Dippers.

Page 250.—Nos.	51	151
Retinned	$2.20	2.40

Dish Pans.

Page 206.—Qt	30
IXXX, doz	$35.50
IXXXX,"	38.50

Plain or Pierced Milk Skimmers.

Page 241	30 and 35
Per gross	$8

Bread Raisers.

Page 226.—Add No	41½
Per doz. list	$3.15

Old Metals.—The market is quite dull, and prices are rather softer than they were at the close of the year. The following quotations represent the current rates paid by dealers in the city:

Heavy Copper	℔ 7 ¢
Light and Tinned Copper	℔ 6½¢
Heavy Brass	℔ 4¾¢
Light Brass	℔ 3¾¢
Lead	℔ 2¾¢
Tea Lead	℔ 2½¢
Zinc	℔ 2⅛¢
No. 1 Pewter	℔ 10 ¢
No. 2 Pewter	℔ 5½¢
Wrought Scrap Iron.	℔ gross ton $7.50 @ $8.00
Heavy Cast Scrap...	℔ gross ton 7.50 @ 8.50
Stove Plate Scrap	℔ gross ton 5.00
Burnt Iron	℔ gross ton 3.00

F. E. Myers & Bro.—The following is the price-list of Pumps manufactured by F. E. Myers & Bro., Ashland, Ohio. It will be observed that it is a relatively lower list compared with some used by other makers. It is subject to a discount of 55 per cent., f.o.b. Ashland:

No. 1, Fig. 328, 3-inch Shallow Well Pump	$13.00
No. 8, Fig. 328, 3½-inch Shallow Well Pump	15.00
No. 5, Fig. 307, 3-inch Deep Well Pump	15.00

No. 268, Fig. 513, Low Down Tank Force Pump	16.00
No. 302, Fig. 477, Spray Pump complete	11.50
No. 320, Fig. 492, Bucket Spray Pump	5.50
" 330, " 547, Knapsack "	10.00

Cordage.—The demand for Rope is sluggish and the volume of business small. In view of the dullness of the market prices are to a certain extent nominal and the tone of the market is rather weak. Quotations are as follows for large lots, f.o.b. factory or New York, the price given being subject to a discount of 1½ per cent. for cash:

	Cents.
Manila, base	7
Sisal, base	4⅛
New Zealand, base	4⅛
Jute, base	4½

Agate and Granite Ware.—Under date January 1 increased discounts on Agate and Granite Ware are announced by the Lalance & Grosjean Mfg. Company of New York and St. Louis Stamping Company of St. Louis, the new discount being made 40 and 10 per cent. The following changes in the list prices of some of these goods are also announced:

Changes in List Prices of Granite Ironware.

Acme Improved Coffee Biggins.

FOR STEAM OR WATER.

Standard size, 10 square feet, $1.30 per section.

Extra large, 15 square feet, $2.00 per section.

Dining Room Radiators.

Perfection, 50 per cent. off list.
Detroit, 50 per cent. off list.

tire surface to the direct currents of cold air, are more efficient than those whose peculiar formation causes a formidable percentage of surface to depend on air partially heated by contact with the outer portion of loops, to perform the work of condensation, we have arranged the inclosed 'special list' to meet the necessities which severe competition occasionally imposes upon steam fitters, and to which we invite careful consideration. Our new three column radiator named Rococo, the shipment of which we shall be able to commence in the very near future, will make our line of special radiators the largest and most comprehensive on the market; and we therefore trust you will give careful consideration to the special list we herewith inclose. In this connection we beg to state that the name of Perfection Flue has been changed to Monarch Flue, and, for the sake of brevity, Detroit Flue Renaissance to Italian Flue."

The special list here referred to is as follows :

Direct Steam

Per square foot of heating surface.

Hight, inches	45	38	32	31	26	25	23	22	20	19	18	16	15	14	13
Italian Flue	..	16	..	.	..	..	..	..	..	..	..	..	..	..	..
Monarch Flue	..	15	17	..	19	..	21	..	..	..	..	23	23	23	..

Direct Water

Per square foot of heating surface.

Hight, inches.	45	38	32	26	23	22	20	18	16	15	14	13
Rococo	16½	17	19	21	..	23	..	25	..	..	..	..
Italian Flue	...	17	19	21	..	..	25	..	..	..	..	..
National Four Column	...	16	18	20	..	..	24	.	..	..	..	..
Monarch Flue	...	16	18	20	22	..	..	..	24	24	24	..
Detroit Flue	...	..	..	..	..	..	21	22	23	..	24	25

Another list they publish refers to the Favorite radiators made by the M. Steele Company, Springfield, Ohio, of which the American Radiator Company handles the entire output.

Added to prices quoted for direct radiators.

In a circular accompanying the new lists they say:

"Severe competition among contractors frequently leads to the use of certain types of radiators, which, having a large amount of heating surface in each section, reduces the cost of manufacture; and while we firmly adhere to the principle that radiators, which, by the scientific formation of their loops, expose practically their en-

DeHaven & Co., Limited, Pittsburgh, Pa., are directing the attention of the trade to a line of Cinderella Kitcheners, which are referred to as being an entirely new series of all cast iron Ranges and adapted for burning hard or soft coal or wood. These Ranges are further referred to as having embodied in their construction many new and desirable features. They are also made with feet and skirting in lieu of the low closet, and they also have a full complement of high shelves and high closets. The reservoir is made of planished copper and holds 15 gallons of water. The trade are invited to send for descriptive catalogues of the Cinderella Stoves and Ranges.

It Is Reported—

Arkansas.

That A. S. Jenkins, Hardware merchant, ARGENTA, has been succeeded by the Lamberson Hardware Company.

California.

That Daly & Snavely, Hardware merchants, GLENDORA, have sold out.

Colorado.

That the Florence Hardware Company, FLORENCE, have been incorporated by John Campbell, Charles Campbell and William Campbell, with a capital stock of $10,000.

Connecticut.

That Arthur Griggs, who has for 22 years been connected with the Hardware firm of N. T. Bushnell & Co., NEW HAVEN, and for the past four years has been manager of their Bicycle department, has resigned as secretary of the company and will go into business for himself.

Georgia.

That Bell & Fite will open a new Hardware store at AMERICUS.

Illinois.

That John Bride is soon to open a new Hardware store at METAMORA.

Indiana.

That a show window in the Hardware store of Pickard Bros., FORT WAYNE, took fire a few days since, resulting in damage estimated at $300.

That L. H. Gonser has purchased a Hardware store at SOUTH BEND.

That Campbell & Davis, in the Hardware business at BLOOMINGTON, dissolved January 1.

Iowa.

That a new Hardware store is soon to be opened at GARDEN GROVE.

That D. M. Deshak is now conducting the Hardware business formerly carried on by D. M. Deshak & Co., GRAFTON.

That F. F. Fisher, WEST BRANCH, is remodeling his Hardware building. He will put in a plate glass front and will also add new counters, shelving, floor, &c.

That the Hardware store of Havan & Moorhead at CLARKSVILLE was broken into by thieves a short time since and robbed of $50 in cash and a few revolvers.

That Reinhart Thompson, COLESBURGH, has disposed of his Hardware business to Thompson & Smith.

Kansas.

That Cox Bros., Hardware, &c., ALTON, have sold out to Wilson Black.

That F. M. Spaulding, Hardware, &c., MINNEAPOLIS, has sold out.

Kentucky.

That the Hardware firm of George O. Hart & Son, PADUCAH, have been incorporated. The directors are George O. Hart, Geo. T. Hart and Harry Hank. The capital stock is $50,000.

Maine.

That H. P. Getchell will soon open a new Hardware store at HALLOWELL.

That McKenney & Hurd, Hardwaremen, lost $9000 in a large fire, at BIDDEFORD, on the 30th ult.

Massachusetts.

That Walter E. Jones of EAST DOUGLAS is about to open a branch store at MANCHAUG.

That fire on the morning of the 6th inst., in the Hardware store of Bartlett & Dow, LOWELL, did considerable damage. The origin of the fire is unknown, and the loss cannot be estimated as yet, although it is large. The insurance, which is $31,000, will, however, cover it.

That James S. Murphy, who has been with the Salem Hardware Company, SALEM, Mass., and has recently withdrawn from that concern, has purchased an interest in the firm of Frank E. Putnam & Co., PEABODY.

That F. Arthur Noble of the Hardware firm of Gladwin & Noble Bros., WESTFIELD, has been elected a member of the board of directors of the First National Bank.

That Frank S. Fowler has severed his connection with the Way Hardware Company, WILLIMANTIC, Conn., to enter the Hardware business as partner with John Morrison, also formerly of WILLIMANTIC, at SALEM. Mr. Fowler has been identified with the Hardware business for about 23 years.

Michigan.

That Abell, Phillips & Co., Hardware, ALLEGAN, have sold out to John F. Dryden, who will continue the business.

That the Saginaw Hardware Company, SAGINAW, have purchased the Shook Hardware stock at PINCONNING, and will continue the business under the management of Harvey Shook.

That on January 1 Clarence H. Emmons of Emmons Bros., Hardware merchants, MARQUETTE, removed to ONTONAGON to take charge of the Corbett Hardware store, S. H. Corbett having disposed of his interest to him. Mr. Corbett will hereafter devote his entire attention to the office of Sheriff, to which he was elected last fall.

Special Notices.

RECEIVER'S SALE.

Notice is hereby given that by virtue of an order of the Howard Circuit Court in the case of John S. Connor, trustee, versus the William G. Fischer Manufacturing Company, the undersigned offers for private sale on and after the twelfth day of January, 895, all of the real estate owned by the said plant and situated in Kokomo, Howard County, in the State of Indiana. He will also offer for sale at the same time all of the machinery, boilers, engines, tools, appliances, patterns and patents belonging to and used in the manufacture of ranges and safes. In making said sale, he will offer to sell the real estate separately and also the machinery, tools, etc., above specified, or he will sell them as an entirety and will receive bids accordingly.

Terms, one-third cash, balance in nine and eighteen months with interest at 6%, with approved security.

G. W. LANDON, Receiver.

For Sale or To Rent.

Hard ware. Stove, Tin, House Furnishing business, established over 25 years. A good store and shop with public hall above, the only shop in vicinity. A first-class dwelling house next door. Close to depot and post office. The stock of goods at present is low, so it will require but small capital. Just the spot for a young man. Would rent the store, shop and house, but would prefer to sell on easy terms. Address "W. B.," Box 35, L. Grangeville, N. Y.

FOR SALE CHEAP FOR CASH.

A full set of Tinsmiths' Tools and Machines in good order. One set of pipe fitting tools, used very little, consisting of vise, stocks and dies cutting from ¼ to 2 inch pipe. Building for shop situated on main street in business center of town of 3000 inhabitants, about 30 miles from New York. All the above, including stock of pumps, stoves, lead and iron pipe, tin, copper, iron, zinc, stove pipe and elbows, dampers, soil pipe fittings, solder, rosin, roofing nails and good will of business, for the sum of $500 cash. Address at once "GOOD OFFER," No. 526, office of *The Metal Worker*, 96-102 Reade St., N. Y.

WANTED.

A practical corniceman can make favorable lease of established shop. Some capital and good references required. Address "H. H.," office of *The Metal Worker*, 59 Dearborn St., Chicago.

WANTED.

A medium size Drop Press in good condition. Send full particulars. Address "DROP PRESS," office of *The Metal Worker*, 96-102 Reade Street, New York.

FOR SALE.

130 tons of Sheet Steel from a wrecked stand pipe, a large portion in good condition. Address

P. O. BOX 155,
Maryville, Mo.

PATENT EAVE TROUGH HANGER FOR SALE.

A rare chance for roofing or tinners' supply manufacturing concern. Latest out. Best in the market. Good investment. Whole or royalty. For sample and further particulars address C. LUMM, Garrett, Indiana.

WANTED.

TOLEDO, O.

A Model Obituary.

This is the way the editor of the Benton *Argus* speaks of a woman who died in that town recently: "While it is almost a crime to speak ill of the dead, we feel it a duty to tell the truth about Miss Mary Boyer, who died last night. She never spoke a decent word about any being, living or dead, and slander sprung from her mouth like the toads from the girl in the fairy tale. If she goes to heaven we don't want to be there, and we believe we voice the sentiment of every man, woman and young lady in this burg. We gladly contribute a quarter for ice for Mary. She will need it."

Why She Named the Baby.

He was a lazy man—never did any chores about the house—but he was great on attending church meetings and singing in a loud and unmusical voice anything that he could hold on to with a few notes.

"Hold the Fort," was his favorite, and about the house he daily sang as best he could this hymn. His wife was a weak little woman and dared not protest.

By and by a baby came.

"Fine boy," said he. "What shall we call him?"

"We will call him Fort," she murmured with more spirit than he had seen since their wedding day.

"Why Fort?" asked he.

"Because then you will want to hold it."

And he sat in the woodshed an hour, wondering whether she was joking or in earnest.—*St. Louis Star Sayings.*

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper in all Forms.

By JOHN FULLER, Sr.

327 Pages, 474 Illustrations, 7 x 10 inches, Cloth. Price, $3.00.

This work, prepared at great labor and expense, is reproduced from *The Metal Worker*, and forms an exhaustive treatise on the Coppersmiths' Art, being the only volume on that subject that has been published. It is beautifully illustrated with 474 pen and ink drawings, and is bound and printed in the best manner.

CONTENTS:

Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea-Kettles; Oval Tea-Kettles; Beer Mullers; Funnels; Coffee Pots; Sauce pans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set for Brazing Joint; Soft Soldering Large Joints; Taking Templates; Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills.

The Influence of Trifles.

Jefferson was fond of telling a story which illustrates in a forcible manner the importance that absurdly insignificant matters may sometimes assume. When the deliberative body that gave the world the Declaration of Independence was in session, its proceedings were conducted in a hall close to which was situated a livery stable. The weather was warm, and from the stable came swarms of flies that lighted on the legs of the honorable members, and, biting through the thin silk stockings then in fashion, gave infinite annoyance. It was no uncommon sight, said Jefferson, to see a member making a speech with a large handkerchief in hand, and pausing at every moment to thrash the flies from his thinly protected calves. The opinion of the body was not unanimous in favor of the document, and, under other circumstances, discussion might have been protracted for days, if not weeks, but the flies were intolerable. Efforts were made to find another hall, free from the pests, but in vain. As the weather became warmer the flies grew worse, and the flapping of handkerchiefs was heard all over the hall as an accompaniment to the voices of the speakers. In despair, at last some one suggested that matters be hurried so that the body might adjourn and get away from the flies. There were a few mild protests, but no one heeded them, the immortal declaration was hurriedly copied, and, with handkerchiefs in hand fighting flies as they came, the members hastened up to the table to sign the authentic copy and leave the flies in the lurch. Had it not been for the livery stable and its inmates there is no telling when the document would have been completed, but it certainly would not have been signed on the Fourth of July.—*Exchange.*

—It is common for a man to bring up his niece, but what do you think of a fellow who raises his ante.—*Siftings.*

PURITAN WASH DOWN WATER CLOSET.

Best Closet Yet Produced for Either Public Places or Private Houses.

In presenting this Water Closet Apparatus to Architects and Plumbers and those interested in Sanitary Plumbing, will say that our aim has been to **Improve the Quality, Simplify the Construction and Reduce the Cost of Fitting in Place,** and we feel confident that we have done all this in the present Apparatus, and more too, **as it will discharge more matter, keep cleaner with less water and make less noise in the operation** than any Water Closet Apparatus now on the market.

The Closet is especially well adapted for Fire Proof Structures, as the Soil Pipe may be run above the floor, either behind or on the face of the finish. Another very good feature—stoppage can only take place in the bowl (where it can be reached from the top). Anything that passes this point will not lodge in the Soil Pipe.

These Closets are made of Vitreous Earthen Ware—that is, an absolutely non-absorbing material, warranted not to craze. Each Closet is stamped with a Bull's Head, our trade-mark.

The tank is provided with a cover finished to match. This cover deadens the noise, prevents fouling by dust and also prevents malicious persons from getting at or throwing anything into the tank.

The tank is worked either by hand action or seat action.

The distance from top of tank to finish of floor is 2 feet 6½ inches. From face of wall to front of Closet, 2 feet 1¾ inches. Depth of seal in Closet 2¾ inches.

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING,

WITH THIRTY-FIVE ILLUSTRATIONS.

43 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.

Maule's "Skeleton" Pipe Die

Two "Points" about it—only 2 (There are plenty more, but we only mention these two here.)

1

The First Cost to you of MAULE'S "SKELETON" PIPE DIE is less than that of any other Pipe-Threading Die—and

2

Before it becomes dull from use it will cut as many perfect threads as the best solid die extant, and when it is dull, you don't throw it away and buy a new one—Oh, no! You simply sharpen the cutters on a common grindstone, and so make it practically as good as it was at first, and this sharpening process may be repeated a number of times.

A sample One-inch "Skeleton" Pipe Die either 2⅜ or 2½ x ¾ thick, by mail, postage prepaid, will cost you 62 cents, and will be sent upon receipt of a Postal note for that amount.

DO NOT SEND US ANY POSTAGE STAMPS.

You may return such sample to us, at our expense, if, after seeing it, you do not consider it worth the price. Don't the above sound as if it might save you some money—if TRUE?

A Famous Firm's Origin.

The following interesting story of the origin of the famous English firm of blacking manufacturers, Day & Martin, is extracted from an article published some time ago in *Tinsley's Magazine:* About one hundred and fifty years ago, when wigs were worn, there lived a maker of perukes at Doncaster. One day a soldier came to the shop to be shaved, and mentioned in the course of conversation, for our barber was cheerful and chatty, that he was obliged to return to his regiment, stationed in York, on foot, as he was without the necessary money for coach fare. The barber had known poverty in his day and was pleased to help a neighbor, so he either gave or lent His Majesty's man the money for the coach. Unlike most good Samaritans, this one was rewarded at once. The soldier returned to York in due course, and wrote to Mr. Martin, the hairdresser of Doncaster, with the returned loan, many sincere thanks, and the recipe for a certain preparation which he said he had long used with excellent effect upon the boots of his officers. Mr. Martin tried the manufacture of this material and found it successful ; he then turned his thoughts to London, where a friend of his, Mr. Day by name, carried forward a flourishing business in Tavistock street, then a rather more fashionable part of town than at the present time. Day & Martin decided that the soldier's recipe was good, and began making their famous blacking from it, and thus were laid the foundations of one of the most splendid and flourishing businesses which London knows.

FOUNDRY PRACTICE.

The Encyclopedia of Founding and Dictionary of Foundry Terms,

used in the practice of molding. Together with a description of the tools, mechanical appliances, materials, and methods employed to produce castings in all the useful metals and their alloys, including brass, bronze, steel, bell, iron and type founding, with many original mixtures of recognized value in the mechanic arts. Also aluminum, plating, gilding, silvering, dipping, lacquering, staining, bronzing, tinning, galvanizing, britannia-ware, German silver, nickel, soldering, brazing, ores, smelting, refining, assaying, etc. By SIMPSON BOLLAND, Author of "The Iron Founder," "The Iron Founder" Supplement. 12mo.: cloth.....**$3.00**

The Pattern Maker's Assistant

Embracing lathe work, branch work, core work, sweep work and practical gear constructions, the preparation and use of tools, together with a large collection of useful and valuable tables. Sixth edition. By JOSHUA ROSE, M. E.; illustrated with 250 engravings; 324 pages: cloth.....**$2.50**

Modern Molding and Pattern Making.

A practical treatise upon pattern shop and foundry work. By JOSEPH P. MULLIN, M.E.: 257 pages; cloth; illustrated. **$2.50**

Iron and Steel Founding.

Illustrated with 39 diagrams. By C. WYLIE. Second edition, revised and enlarged: 324 pages; 8vo; cloth... .....**$2**

The Practical Brass and Iron Founder's Guide.

A treatise on brass founding, molding, the metals and their alloys, etc. By JAMES LARKIN, late conductor of the brass foundry department in the Penn Works, Philadelphia. A new revised and greatly enlarged edition. Contents: Among the most important and entirely new sections of this edition of this valuable and popular book are the following: Behavior of Metals and Alloys in Melting and Congealing; Malleable Iron Castings; Wrought Iron or Mitis Castings; Manufacture of Steel Castings; Casting of Brass; Casting of Bronze; Bell Founding; Chill Casting; Casting without Core; Casting on to Other Metals; Casting Iron and Other Metals Upon Lace, Embroideries, Fern Leaves and Other Combustible Materials; Some Modern Bronzes. In one volume; 12mo; 400 pages.....**$2.50**

American Foundry Practice.

Treating of loam, dry sand and green sand molding, and containing a practical treatise upon the management of cupolas and the melting of iron. By THOMAS D. WEST, practical iron molder and foundry foreman. Fully illustrated. Eighth edition, revised. 408 pages: cloth..... **$2 50**

The Iron Founder.

A comprehensive treatise on the art of molding, including chapters on core-making, loam, dry sand and green sand molding, also crystallization, shrinkage and contraction of cast iron and a full explanation of the science of pressures in molds, added to which are formulas for mixtures of iron, tables, rules and miscellaneous information. By SIMPSON BOLLAND. Illustrated with over 300 engravings. 12mo, cloth....**$2.50**

The Iron Founder Supplement.

A complete illustrated exposition of the art of casting in iron, comprising the erection and management of cupolas, reverberatory furnaces, blowers, dams, ladles, etc., mixing cast iron, founding of chilled car wheels, malleable iron castings, foundry equipments and appliances, gear molding machines, molding machines, burning, chilling, softening, annealing, pouring and feeding, foundry materials, advanced molding, measurement of castings, wrought iron, steel, etc. Also the founding of statues, the art of taking casts, pattern modeling, useful formulas and tables. By SIMPSON BOLLAND. Illustrated with over 200 engravings; 400 pages; 12mo: cloth..... ...**$2.50**

DAVID WILLIAMS,

Bookseller and Publisher,

96-102 Reade St., - New York.

IS IT RIGHT?

Is it right to presume that the metal workers of America do not know the difference between common galvanized iron and good galvanized iron? We don't think so.

Would it be right to take advantage of that ignorance, even if it did exist? We don't think so.

Is it wise to conduct a business on that sort of a basis? We don't think so.

Taking advantage of other people's lack of expert knowledge is mighty poor business. Very few of us but have to take other people's words for things we are not wholly familiar with. Are we "fair game" for imposition because we depend on other folks' honesty? As a matter of fact, metal workers do know the difference between poor iron and good iron. They may be imposed upon once in a while because they believe in the dealer's honesty and do not watch him, but sooner or later they will find out the imposition, and then the dealer will be sure to lose their trade forever.

A dealer or manufacturer who sells inferior goods on the representation or with the understanding that they are first-class, is not a safe man to deal with. If he will sell a single sheet of iron that way, look out for him on a car load.

When we sell "Star Best Bloom," we guarantee it perfectly flat, full weight without variation, and absolutely true to gauge. It's the best grade of galvanized sheets we know how to procure. Doubtless, unscrupulous persons can occasionally sell inferior sheets at the price of the "Star." Doubtless they would make a little bigger profit on that one sale, but the big profits that result in lost trade are not so very profitable after all.

For a certainty of quality and an absolute guarantee of grades, address

MERCHANT & CO., Inc.,

PHILADELPHIA, CHICAGO, NEW YORK, BROOKLYN.

Hicks' Guide FOR Builders,

Comprising an easy, practical system of Estimating Materials and Labor for Carpenters, Contractors and Builders.

A comprehensive guide to those engaged in the various branches of the building trades.

By I. P. HICKS.

160 Pages, - 114 Illustrations.

Bound in Cloth, Price, - $1.00

This book presents to the trade, first, an easy, practical system of estimating materials, in concise form for reference. In the next place is given the average day's work of all kinds, and the average rates on which to figure in almost every detail of building construction.

Material and Labor, including Lumber, Carpentry Work Masonry, Plastering, Hardware Painting, etc., are among the principal divisions These in turn are illustrated and ably treated under numerous sub-divisions, showing step by step the entire work of estimating, contracting and building, together with the best and most practical methods of doing the work.

This is followed by a section given to the Geometrical Measurements of Roof Surfaces with numerous illustrations and examples. It embraces a new and simple system of framing curved roofs, also the simplest methods of roof framing of every description, with practical examples thoroughly illustrating nearly every conceivable form of roof and showing many points never before presented.

The volume also contains a chapter on Mitering Planceers, Moidings, etc., illustrating and describing how to make, in an easy, practical manner, many joints which are the source of no little trouble and annoyance on the part of the workman.

The Meaning of Horse-Power.

The unit measurement of mechanical power was introduced by James Watt and called a "horse-power." How this name originated is well told in the *Magdeburger Zeitung*. One of the first steam engines built by Watt was to furnish the power for the pumps in the brewery at Witbread, England, which up to that time was supplied by horses. The contract called for as much power as furnished by a strong horse, and in order to get as powerful an engine as possible the brewer ascertained the amount of labor performed by a horse by working an exceptionally strong horse for full eight hours without a stop, urging the animal with a whip until it was exhausted, and thereby succeeded in raising 2,000,000 gallons of water. Considering the hight of the reservoir this labor represents the present unit of a "horse-power," that is, the lifting of 168¾ pounds to a hight of about 3 feet per second. This result, however, was obtained by exceptional methods and should not be considered the basis of measurement of mechanical power. Actually, the power of the average horse is barely sufficient to lift 65 to 70 pounds 3 feet high per second.

— HE: "Even if you women had the ballot you would simply cast your votes for the handsomest candidates."

SHE: "Well, if we did, there would not be any more pug-nosed, bull-necked toughs in high places."—*National Standard.*

—FATHER (impressively): "Suppose I should be taken away suddenly, what would become of you, my boy?"

Irreverent Son: "I'd stay here. The question is, what would become of you?"—*West Chester Critic.*

—WIFE: "You were out last night."

Husband: "You are mistaken. I was in just seven dollars."—*Dansville Breeze.*

A. L. BURTIS, Lockport, N. Y.

— Sir Robert Rawlinson, who has just taken the chair of president of the British Institution of Civil Engineers, and who is now overwhelmed with honors and dignities of every kind, commenced life as a stonemason. Passing one day through Chorley street in London a short time ago with the Lord Chief Justice, he asked the latter, pointing to a step in front of a house, "How do you think that step is set?"

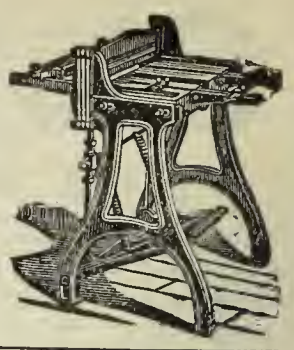
"How should I know?" exclaimed Lord Russell, laughingly.

"I do," was Sir Robert's reply, "for I set it myself."

— Professor: "What degree of cold can a man stand?"

Student: "I don't know, sir. I am not acquainted with any of the Boston girls yet."—*Detroit Free Press.*

—Country Minister: "There was a stranger in church this morning."



Wife: "What did he look like?"

Minister: "I did not see him."

Wife: "Then how do you know there was a stranger in the congregation?"

Minister: "I found a dollar bill in the collection."—*Truth.*

GOODWIN'S

Improved Book-keeping and Business Manual,

Revised and Enlarged Edition. BY J. H. GOODWIN. Forty-first Thousand.

The author of this book has sought among bookkeepers of all degrees of ability and business men in various kinds of business for points which would be likely to prove of value either to a bookkeeper or to a business man. In these interviews he has been permitted to inspect the books of some of the largest business houses of the country, and to learn the methods employed by them. The work therefore embodies not only the results of his own experience, but that of at least a hundred other bookkeepers of the highest standing in the profession, from whom there have been received and are here given *a great variety of valuable points.*

Printed in two colors, on an excellent quality of paper, and is substantially bound in dark, rich cloth. Sent, post-paid, on receipt of price ($3.00) by

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstrat on is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

PRICE, POST OR EXPRESS PAID, $5.

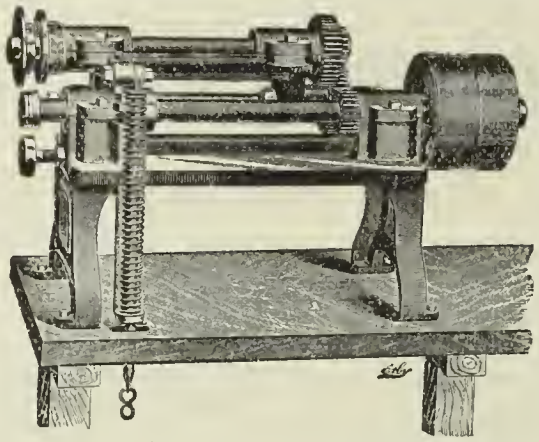
The "Lyon" Shear.

ONE-THIRD EXACT SIZE. No. 80.

(PATENT APPLIED FOR.)



THIS CUT REPRESENTS LEFT HAND.

This shear is especially adapted to **Cornice and Tin Work,** being so constructed that **Scrolls, Circles,** &c., can be **perfectly** and **accurately** cut, which **cannot** be done with the ordinary shear.

A New Bending and Forming Tool

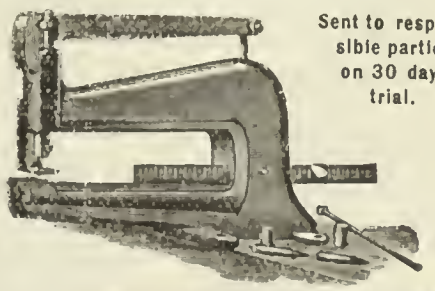
For bending and forming stays and braces for cornice or other work where band iron or steel are to be used. Will bend any shape ¼ x 2 in. Band or Bar.

THE KEENE BRAKE,

AND SHEET METAL WORKING MACHINERY A SPECIALTY.

GEORGE C. KEENE & CO., - Cincinnati, O.

PRESSES, DIES AND TOOLS



For Can and Tinware Manufacturers.

Dies for Cutting, Drawing & Stamping Tinware

Estimates given at sight of samples of drawing work.

Send Sample for Prices before ordering elsewhere.

DOVER MACHINE WKS, Dover, Del.

Sent to responsible parties on 30 days' trial.

CLOUGH'S IMPROVED FOOT PRESS,

For Sheet Metal Work. Punches to center of 36 in. sheet or 5 in. pipe 30 in. long. Handiest Press made. Dies and Punches furnished with every Press. Weight about 175 lbs. For Descriptive Circular and Price, address

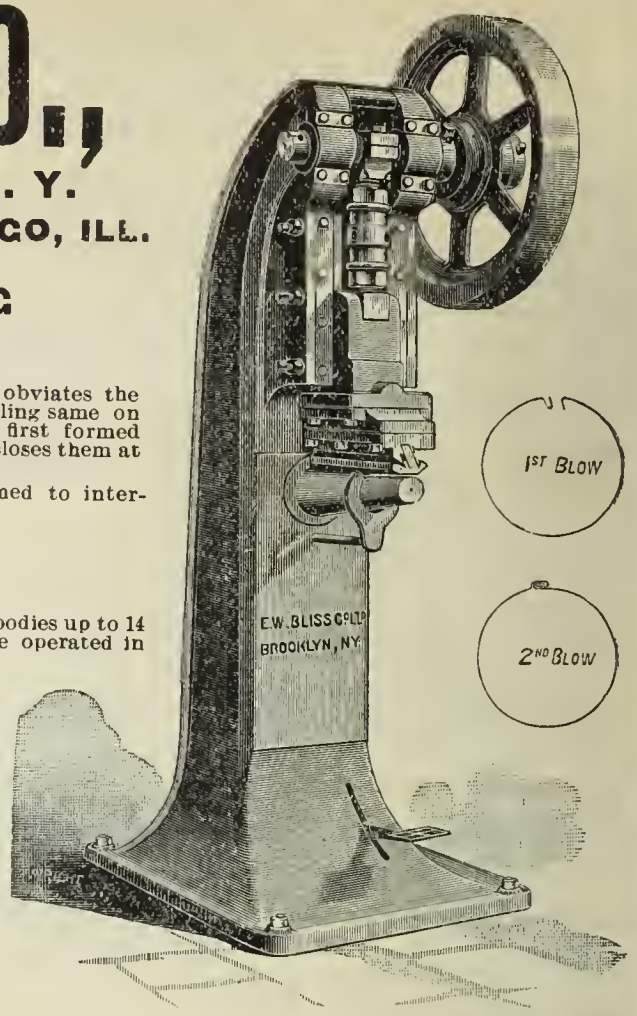
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation

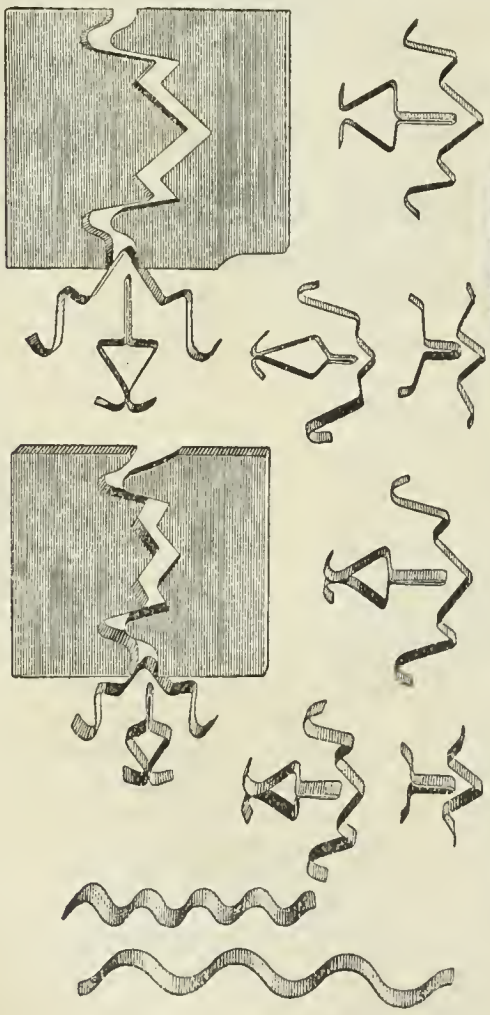
Second—That both edges are hooked at one blow.

Third—That the hook forming and closing are done in one handling.

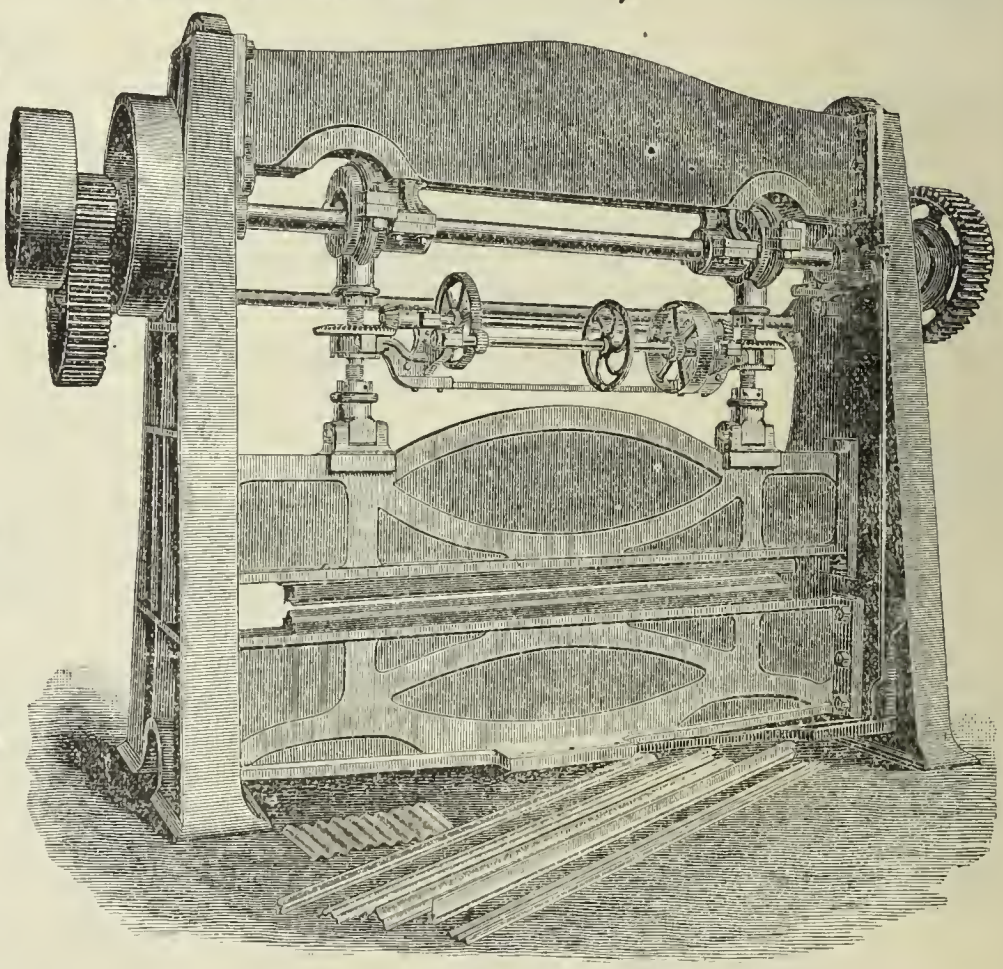
Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.

PRESSES, PUNCHES, SHEARS,



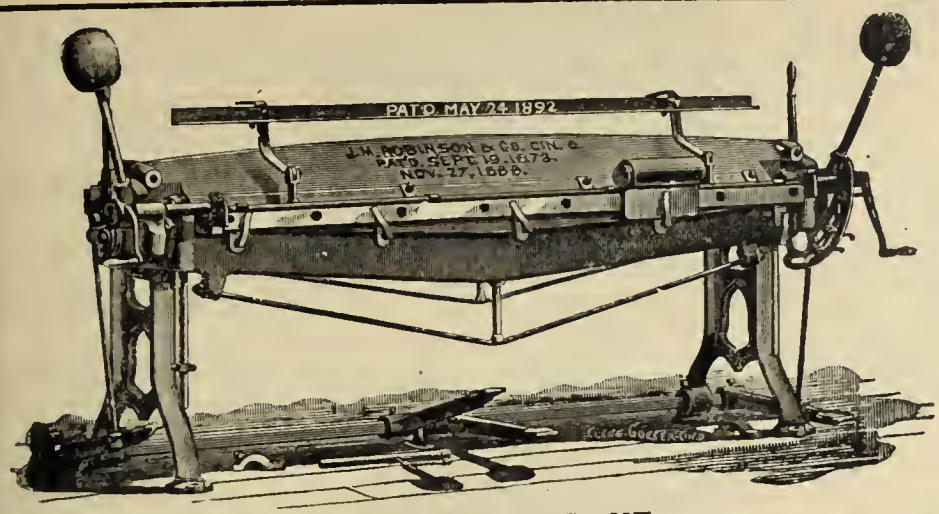
DROP HAMMERS,



DIES, SPECIAL MACHINERY, &c.

THE STILES & PARKER PRESS CO.

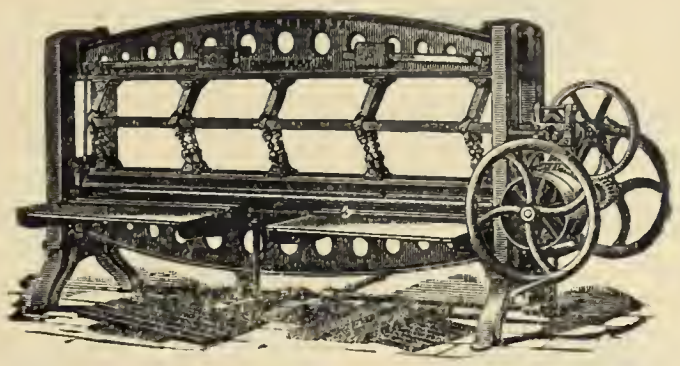
GEO. A. OHL & CO., 157, 159, 161 Oraton Street, NEWARK, N. J.



SOME SAMPLES OF WORK PRODUCED ON THESE MACHINES.

Improved Sheet Metal Power Press.

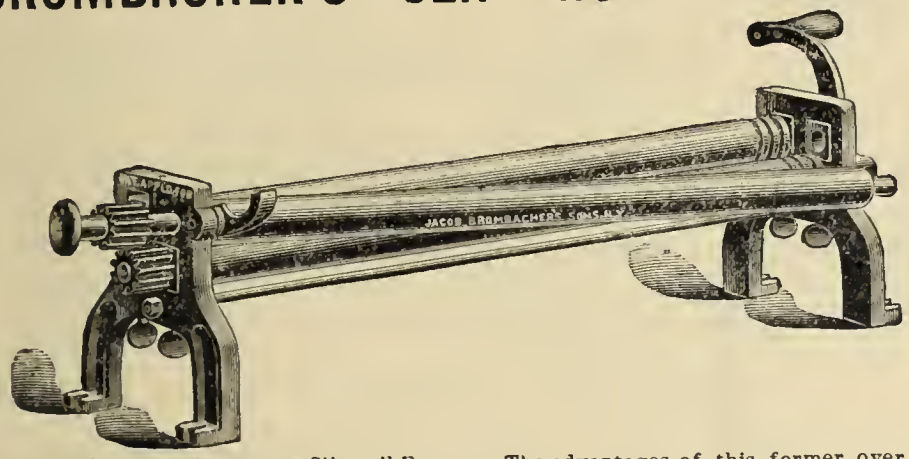
The above cut represents a ten foot power press weighing 20,000 pounds. This machine will make a skylight bar seven (7) bends at once of No. 24 iron, corrugate as heavy as No. 14 iron, also will press out mouldings of any shape that can be pressed between two dies. It is provided with a special mechanism for raising and lowering the hammer, with the die holder and die, to suit the different heights of the latter.



THE "GLOBE" CORNICE BRAKE.

With which to form Sheet Metal into Cornice Mouldings, Ridge Caps, Skylight Bars; and with Beader and Gutter Former attached to Brake (price of which is extra), Bead and Form Gutters. Cornice manufacturers' Steel Straight Edges, 30 inch to 10 foot lengths.

ROOFING MACHINE.



With Dies suitable, will form Sheet Metal Roofing, Siding, Ceiling, Weather-Boarding, Skylight Bars, Metal Lathing, Gutters, Ridge Caps, Escalloped Steel Sheets and Cattle Troughs.

J. M. Robinson & Co., Mfrs.,

225-229 W. Second St., Cincinnati, Ohio, U. S. A.

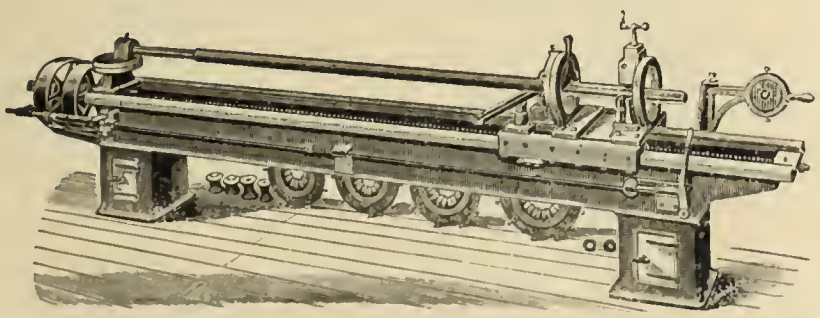
BROMBACHER'S SLIP ROLL FORMER.

Above cut represents our new Slip-roll Former. The advantages of this former over ordinary formers are

First, that the rollers are made of cold rolled steel rolls.

Second, it has cut gears with consequent smoothness of operation.

Third, the thumb screws are inserted from underneath, consequently the box carrying the rollers rests on the screws instead of the screws carrying the boxes and rollers; this obviates the possibility of breaking thumb screws.



Fourth, we do not have to split one frame in order to obtain the slip-roll mechanism, and we therefore have all the rigidity of ordinary formers with all the convenience of slip-roll formers.

Above design makes the smoothest and quickest operating and stiffest Former on the market and they are sold at the price of ordinary Stove Pipe Formers.

JACOB BROMBACHER'S SONS - - No. 30 Cliff St., N. Y. City.

Established 1833 Incorporated 1887.

Ten foot Corrugated and Plain Round Conductor Pipe, Square Corrugated Conductor Pipe, and Ridge Roll Machine.

Also New and Improved Machinery for Manufacturing Metal Roofing.

The Metal Worker Essays on House Heatir by Steam, Hot Water and Hot Air.

WITH INTRODUCTION AND TABULAR COMPARISONS.

Second edition, revised. To which has been added a selection fr the Letters of Criticism on the Essays as originally published in T METAL WORKER and a chapter on Proportioning Radiating Surfaces.

How to Effectively and Economically Heat a Given Building

is a problem of the highest importance to the Architect, Builder and Owner. Shall stea water or air be employed as a medium? What are the relative merits of the differ systems? By what means can a comparison be instituted that will show their respect advantages?

The essays comprised in this volume are some of the results of a prize contest conduc by *The Metal Worker* some time since. They include the prize essays and selections fr the best of the others. The foundation of all the essays is a house, the floor plans a elevations of which were the result of previous competitions conducted by *Carpentry a Building*. The elevations and the plans of this house were carefully printed on separ sheets adapted to receive at the contestants' hands lines indicating the position of heat runs of pipes, location of radiators, etc., thus insuring a uniformity in presentation, a also holding the competitors to exactly the same conditions. The result, therefore, t hook in which are shown: First, different means of heating the same house, among wh may be instituted various comparisons, and, second, several different interpretations each of the several methods, among which also instructive comparisons may be institute

The work is not a mere theoretical consideration of principles and a statement of fa gained by inquiry in the trade; but, instead, a collection of essays by practical men, ea showing how one man would go about heating the building in question, using the mea with which he is best acquainted in practice. Features of the book which are not the le important among its numerous merits are the *lists of items and statement of cost* companying the different essays. Never before in the history of the heating trades has th been offered such a collection of information directly from the practice of those who a actively engaged in the heating business as is contained in this volume.

"The whole forms a valuable and instructive exposition of current practice house heating."—*American Machinist.*

"Covers the ground very completely."—*Scientific American.*

"It will be found as complete a compendium as possible of existing informati on this subject, amply illustrated by drawings."—*The Sanitary Era.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we only had the information contain in this volume in earlier life, we could now have dollars where we only ha buttons."

407 pages, 7 x 9½ inches. Handsomely bound in clot One volume. Price, $3.00.

KERNAN Smoke Consumers Lead

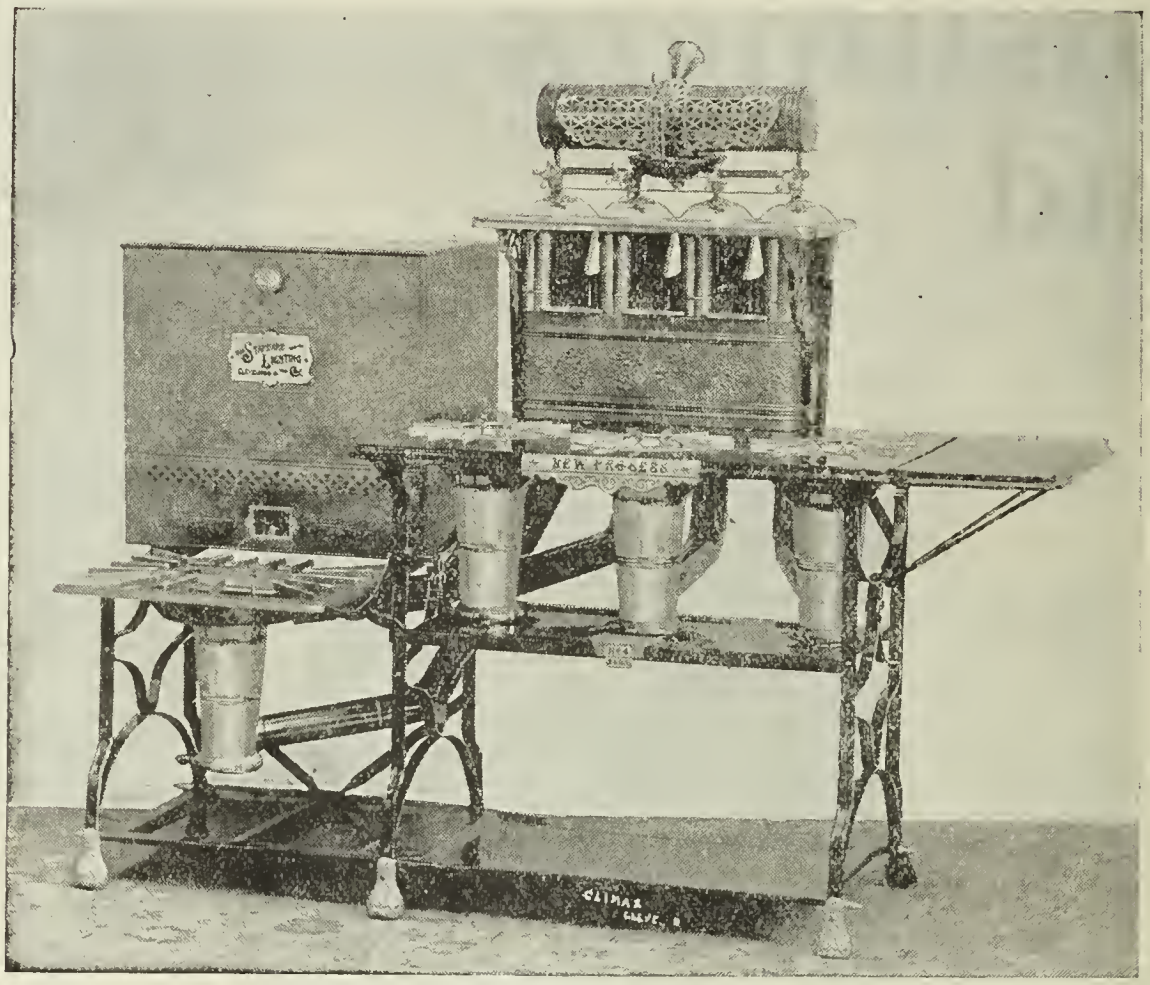
In all the sections of the country where soft coal is used.

SECTIONAL VIEW,

showing the principle in the Kernan Smoke Consumer Furnace of a heated current of air entering the fire-pot, igniting with and consuming the smoke from soft coal.

Now is the time to secure the agency and thereby control the furnace trade of your locality. Do not waste time and money experimenting on new and untried constructions. The

Kernan Smoke Consumers



have been used for several years in all parts of the country and with every variety of soft coal and are now conceded by the trade and public to be the only warm air furnace in which soft coal can be cleanly and economically used.

Send for Reference Catalogue of Soft Coal Furnaces.

Hoffman & Weller, Los Angeles, Cal.
Milton Rogers & Sons, Omaha, Neb.

DEALERS!

All Weak Points About Vapor Stoves

are not called to your attention by unscrupulous manufacturers or their salesmen. They often palm off imperfect and faulty stoves as perfect, and jolly you into the belief that you have struck a bargain.

But when summer comes and truth comes to light, as it invariably does in the vapor stove business, vexation and disappointment come with it. Vexation, because you have been duped, disappointment, on account of the loss of a season's profit.

Better handle a *good line* at a fair profit than a *poor* line at a *bargain* profit. There is no such thing as a "bargain," especially in the vapor stove business. *Proof*—Review the past???

Better buy from a responsible manufacturer or his legitimate jobber, especially of one whose integrity is unquestioned, and one whose knowledge of the vapor stove business secures you an honest deal and prevents the imposition of fakes or shoddy goods. *There are a few of us left.*

Better buy a good line to be successful. A *bad* stove is a very poor purchase at *any* price.

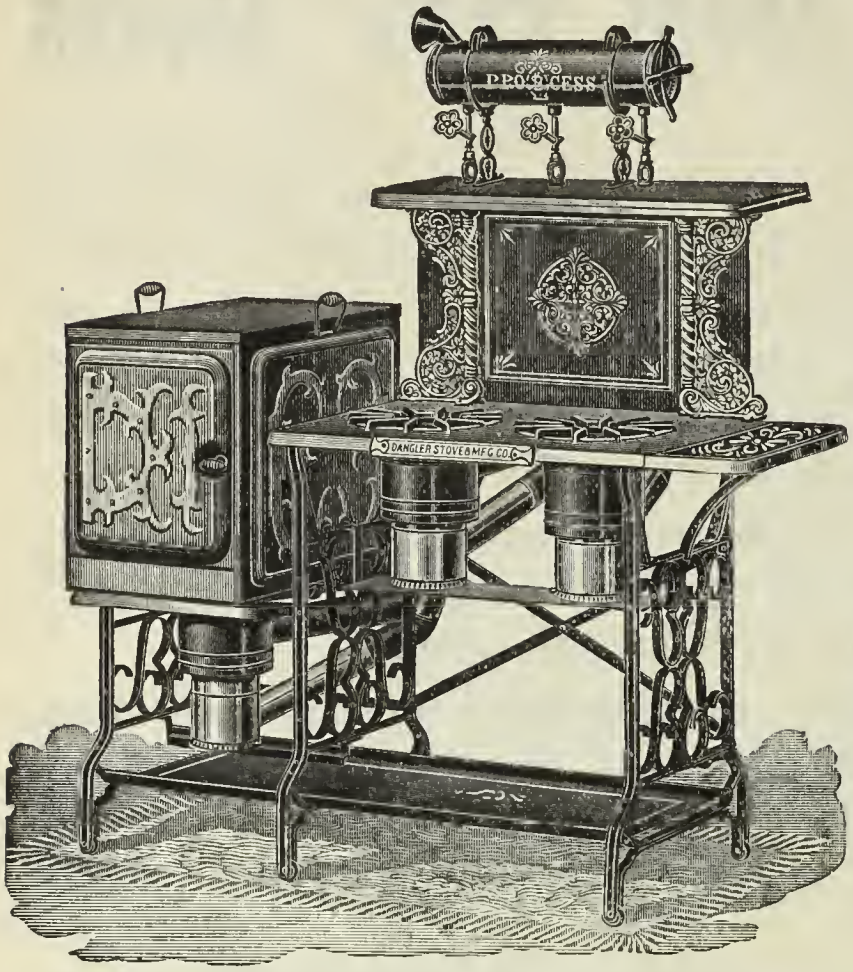
Better look for Protection.

Protection in order to be of service to you must begin at home. See that this point is not overlooked when casting about for a line for 1895.

Better think this over.

The old adage reads, "Make Haste *Slowly*." This is a weighty proverb. The more so when you consider that the best versed manufacturers in the vapor stove industry are not offering any new inventions or innovations for the coming season.

Yours respectfully,



THE SCHNEIDER & TRENKAMP CO.,

Facts of Interest to the Public.

Our "PROCESS" for 1895, we can say unqualifiedly, is the

MOST PERFECT WORKING

PROCESS STOVE EVER PLACED ON THE MARKET, and HAS NO EQUAL.

In calling attention to our

NEW GEM STOVE,

We offer the trade a STOVE FOR THE PEOPLE and FOR THE TIMES.

THE GEM STOVE is CONVENIENT

in SIZE, with the same sized flame as the PROCESS doing the same amount of work with **less fuel,** and at an original cost of only about ONE-HALF that of the regular high Stoves. This Stove is ABSOLUTELY our own, and CAN BE MADE ONLY BY US, and as pioneers in this business, the public naturally look to us for progress, while some of our competitors, who can only make the old line, call such improvements, "an innovation." Our GEM and PROCESS, together with our DELIGHT, celebrated JUNIORS, Individual and Single Generator Burner Stoves, &c., will give our trade a decided advantage over their competitors,

One thing is certain, the "Culinet" is new. It's different from anything you ever saw. It fairly bristles with points, and they are not the same old points that have been talked for years. They are new points, because the "Culinet" is a new stove.

The "Culinet" is the most sensible cook-stove in the world. And the most convenient. The reasons cannot be told here, but they are good reasons. People are talking about the "Culinet" more than any stove for ten years. That kind of a stove will sell; it has sold already; and people who use it praise it.

This year's leader is

WALKER'S

Culinet

IMPORTANT ANNOUNCEMENT.

To Our Patrons and the Trade Generally:

Our new Catalogue for 1895 will be ready for distribution within a few weeks. We take this means of announcing in advance of its publication that we have very carefully studied the requirements of the trade in every particular, and that our lines will be complete. We will place on the market specialties in entirely new goods that will commend themselves both by reason of popular prices and their many attractive and desirable features. In addition to our very popular Oilgas Cook Stoves, containing our improved 1895 Burners that are giving such perfect satisfaction, we have something entirely new in the line of special Lamp Stoves at special prices; also Sheet Steel Circular Burner Oil Cook Stoves. Write for further information and prices.

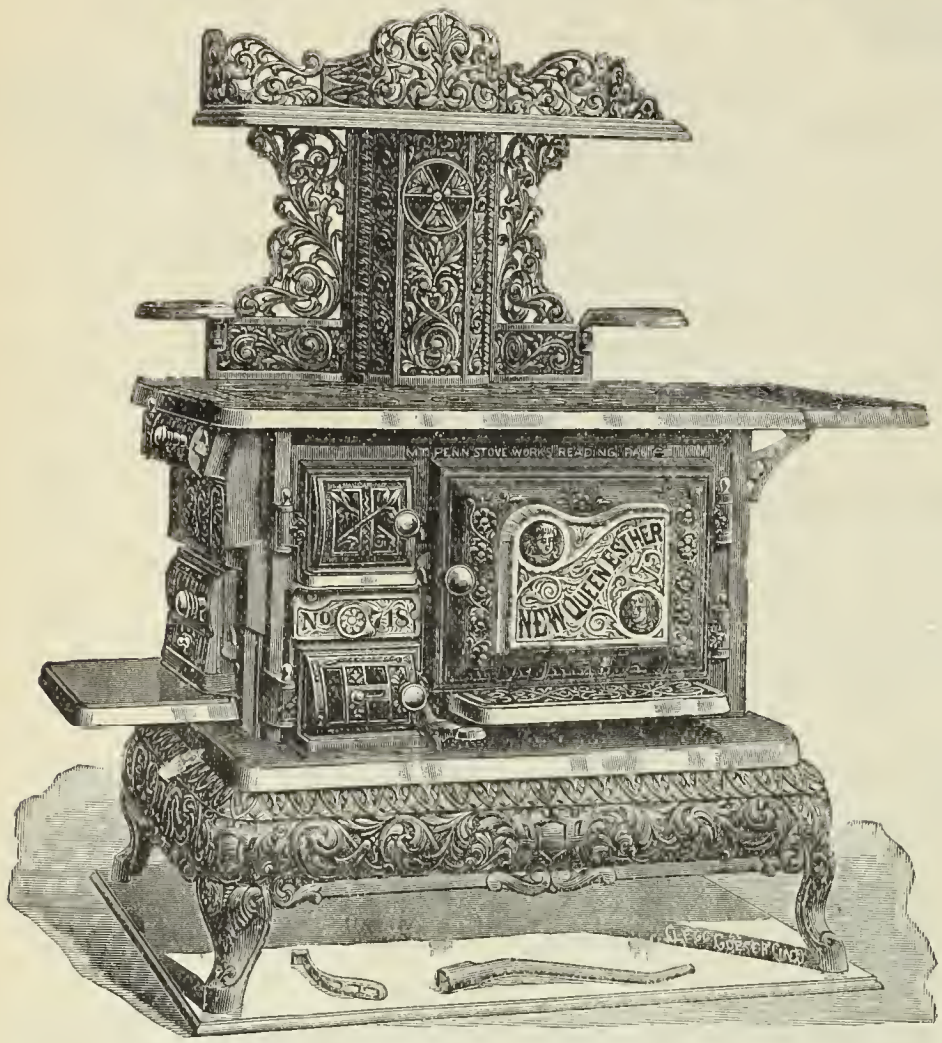
HOW TO REDUCE NATURAL GAS BILLS.
THE "PITTSBURG" GAS STOVE DOES IT.



Pronounced by Experts and Users to be the Cheapest, Best and Most Economical Gas Stove in the market. The secret of its success is not only in burning the gas perfectly, but in preventing any of the poisonous gases (the waste product of combustion) from escaping into the room, and yet extracting all the heat from the gas. **No waste heat passes into the chimney, but only the waste product of combustion.**

By making slight changes in burner this stove can be used for Artificial Gas also. If wanted for such purpose, please order "for Artificial Gas."

Full information cheerfully furnished. Manufactured exclusively and **for jobbing trade only,** by

DIXON-WOODS COMPANY, - Pittsburg, Pa.

A Good Army Story.

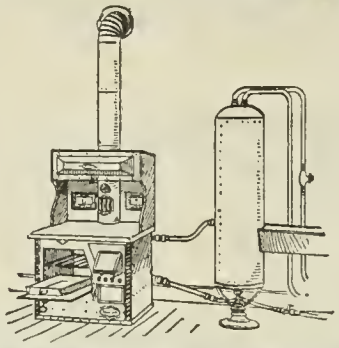
One of the best army stories I have heard for a long time was told by a Johnstown veteran of the Forty fifth Regiment. The hero of the story is a Jew. The veteran announced one day that he was going to the sutler's quarters, some two miles away, to make some purchases. The Jew, Conn, lying in his tent, heard this, and calling the veteran in, said:

"I give you 50 cents, you buy me tobacco."

The 50 cents was handed over. The veteran made his trip to the sutler's quarters, but could get no tobacco. Instead, he bought 50 cents' worth of cigars, all of which except two he gave away to the boys, and one of those left he smoked himself. The remaining one he carefully wrapped up in half a dozen papers and handed into the tent to Conn. The Jew spent some time in getting all the wrappers off, and was almost paralyzed when he found it contained a single cheap cigar.

"What you do mit mine 50 cents?" said the Jew.

His friend told him the sutler had no tobacco, so he bought cigars. Conn gazed long and earnestly at the small return he had got for his half dollar, and then, looking up at his friend, said:



"Vell, de next time I sends a d—n fool for tobacco I goes myself."—*W. J. Press.*

Blacking for Iron.

For coloring iron and steel a dead black of superior appearance and permanency the right article has long been sought, and to meet this want M. Mazure now proposes a fluid, of which, according to the New York *Sun*, the following is the formula: One part bismuth chloride, 2 parts mercury bichloride, 1 part copper chloride, 6 parts hydrochloric acid, 5 parts alcohol and 50 parts water, these being, of course, well mixed. To use this preparation successfully—the article to be blacked or bronzed being first made clean and free from grease—it is applied with a swab or brush, or, better still, the object may be dipped into it; the liquid is allowed to dry on the metal and the latter is then placed in boiling water, the temperature being maintained for half an hour. If, after this, the color is not so dark as is desired for the purpose, the operation is simply to be repeated, and the result is in the highest degree satisfactory. After obtaining the desired degree of color the latter is fixed, as well as much improved generally, by placing for a few minutes in a bath of boiling oil, or by coating the surface with oil and heating the object until the oil is completely driven off. The intense black attained by this easy method is said to be admirable.

— ON THE ROAD TO DALLAS.—They were talking about Texas.

"Oh, yes, I have been down there," said the traveler, "and I remember it very well. I ought to remember it. I was invited to 'git into' a little game of poker, and when I got up from the table I hadn't a dollar in my pockets, not a cent."

"Of course," said some one who was a believer in hospitality, "they entertained you and then gave you a ticket to your home."

"Oh, no," answered the traveler, thoughtfully. "The man who owned the house in which we were playing left the room when I announced that I was broke. Presently he returned with a lantern and beckoned to me to follow him. I stepped out of the room, going carefully so as not to disturb the players. My host led me out the front door to the road. Placing the lantern in my hand, he pointed into the blackness of the night.

"'Here is a lantern,' he said, 'and this is the road to Dallas.'

"Dallas, my friends, was 160 miles away."—*New York Tribune.*

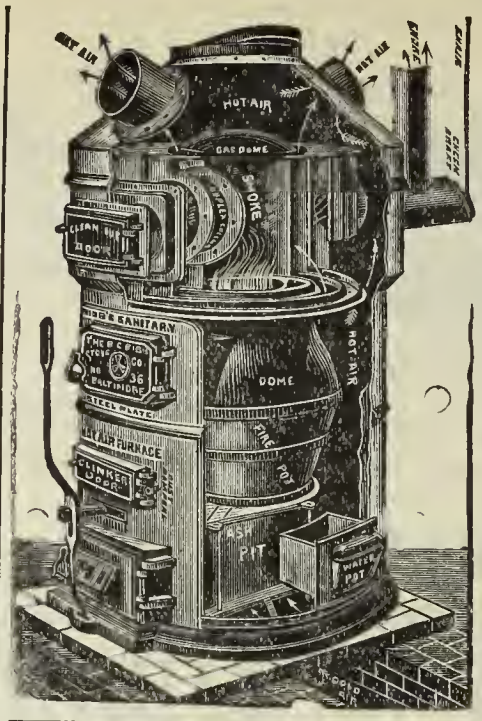
— "ALAS!" exclaimed Fogg, striking his empty pocketbook. "Would that man were like pie crust; then the shorter he is the richer he would be."—*Boston Transcript.*

Mistakes of Novelists.

All novelists and writers make slips or blunders in greater or less abundance, says a writer in *Pearson's Weekly*, but it is among the lady novelists that the most frequent and amusing blunders must be looked for, and in "Ouida's" works they abound with greater frequency than in the works of any other living novelist. In one of them will be found a horse winning the Derby three years in succession; guardsman sitting up all night drinking hard, smoking perfumed cigarettes, gambling for fabulous sums, and starting forth in the morning, after a breakfast of ortolans and green chartreuse, fresh as a daisy, and prepared to do deeds of prowess in the hunting fields or at the covert side—and that great feat, too, performed by a man with a "tawny mustache and flanks like a greyhound," who, while snipe shooting, espies an eagle, "a dim speck in the ethereal vault." What cares he that his cartridges only contain tiny snipe shot? Not he! He bangs away with unerring aim, and "slowly the king of birds, with his glorious pinions outstretched, sinks at his feet a corpse." In another of her books a gentleman performs a similar feat, but this time, for the sake of variety, with a rifle bullet. Walter Besant, in his novel "St. Catherine by the Tower," speaking of the riverside inhabitants, says: "They go to church but three times in their lives—when they are baptized, when they are married, and when they are buried." It is only people in novels who go to be buried during their lives. Rider Haggard, in his "King Solomon's Mines," made an eclipse of the moon take place at the new moon instead of at the full, when the earth is between the sun and the moon.

— THE CZAR'S RUSSIAN DOCTOR.—Dr. Zacharin, who treated the Czar, is known as one of the most impolite men—to use no stronger expression—in his profession. He is a fierce democrat and has respect for no one. Like Professor Schweninger, the physician of Bismarck, he insists upon the literal execution of his orders, it matters not who the patient may be, and will brook no interference. He is a man of middle age and began life as a butcher boy. He has become one of the richest men in Russia by his practice.

When the malady of the Czar began to look serious the Emperor at once asked that Zacharin be sent for. A telegram was dispatched to the Governor of Moscow, says one of the imperial attendants in the Copenhagen "Politiken," ordering him to send Zacharin to St. Petersburg. The Adjutant of the Governor found the Professor in his clinic, and asked him to make as rapid preparations as possible, as the fast train would leave the city for the capital in a few hours.

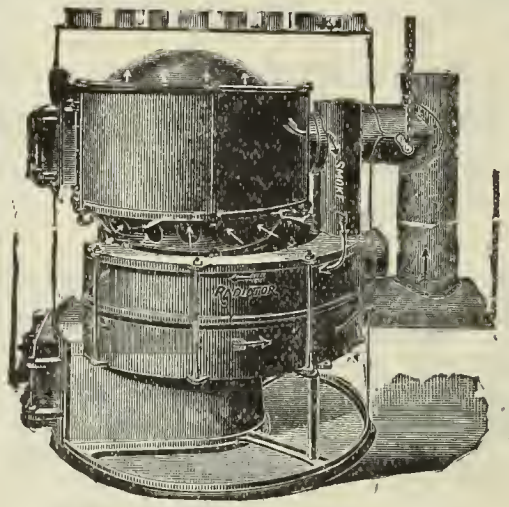


"The fast train? What?" was the Professor's answer. "The Emperor of Russia is sick, and you talk of the fast train! Will you kindly order me an 'extra,' which must be ready in half an hour."

At the time appointed he started for St. Petersburg, and, arriving there, hurried with an adjutant to the castle.

"His Majesty awaits you, Professor," said a chamberlain who received him at the entrance. "Your rooms are at the head of the stairway, and you will find everything in readiness to make your toilet after the journey."

"Toilet!" answered the physician. "His Majesty is sick and wants my advice, not to see me in 'toilet.' Take me to him at once."



The Emperor was lying in bed in a dark room. All the windows were closed and the curtains were down. The Empress sat in a rocking chair next to the bed. Three body physicians stood about the

room. Zacharin entered the room, made his obeisance to the imperial pair, but almost totally disregarded the presence of his colleagues.

"What an atmosphere! It is disease breeding. And in this atmosphere you allow Russia's sick emperor to lie? Quick! Put back the curtains and raise the windows." Such was his first order.

He then became silent, and began a thorough examination of his patient. Then, taking a chair, he rested his arm on his knee and began to think. Almost ten minutes passed without his uttering more than a half dozen words. As the other physicians, who apparently did not like his action, began to talk softly to one another he rapped with his pencil and told them to "be still."

The year before when the Emperor was suffering from influenza, Professor Zacharin was called also to the palace of the Czar. Upon his arrival, with his assistant, the doctor was asked to take a suite of rooms on the third story. Zacharin refused to be housed there. He had the habit, he said, of always sleeping on the ground floor, and did not wish to change his habits. It was bad for the health. He had his way and was led to chambers on the first floor.

The Czarina, wishing to show her friendly interest in the physician, invited him to take his meals with the family at the imperial table. To this Zacharin replied:

"I never eat with women, Your Majesty."

He insisted upon being served in his rooms, and the good natured Empress allowed him to have his way.

One day the Czarina, believing that the evil from which the Czar suffered was increasing, descended to the room of the doctor and begged him to examine the temperature of the patient and see if it were not higher.

"My assistant," replied the autocratic physician, "will go examine him."

A little later the assistant returned to the rooms with the announcement that there had been no change in the temperature of the sick ruler.

"You see, Your Majesty, that it is not worth while to disturb me."

The doctor was accustomed to go about the palace in the early mornings wearing a gown and the felt slippers of a peasant. But no one ever dared to call him to account.

The doctor gives away large sums of money yearly to the poor. Poor students he always treats free of charge. But when he finds a rich patient he makes him pay for all that he has lost.—*N. Y. Tribune.*

— THE REAL DANGER.—One of Detroit's budding hunters, a youth of 22 summers, went the other day to a veteran in that line to borrow his gun and dog for a day's outing.

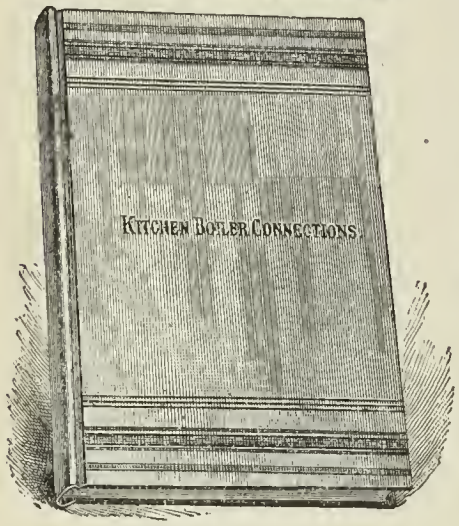
"I'm sorry," said the veteran, with a very palpable note of doubt and fear in his voice, "but I can't let you have them."

"Why not?" asked the young hunter, bridling at the imputation on his skill.

"Because I'm afraid something might happen."

This made the young man real mad.

"You talk," said he, "as if you were afraid I might shoot myself."



"No," protested the veteran earnestly, "it isn't that. What I'm afraid of is that you might shoot the dog," and the young hunter turned his back on the veteran in a towering rage.—*Detroit Free Press.*

— "PARKER uses a great deal of cologne, it seems to me. Awful bad form!" said Hawkins.

"It would be in you," said Hicks, "but it's family pride with Hawkins. He comes of old colognial stock."—*Harper's Bazar.*

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth, Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

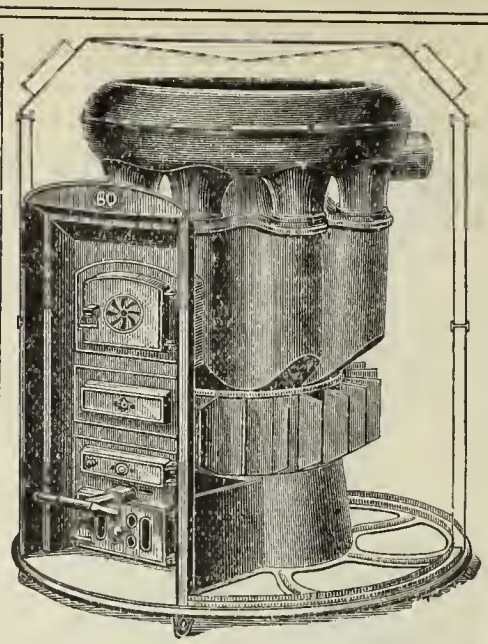
The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*



Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

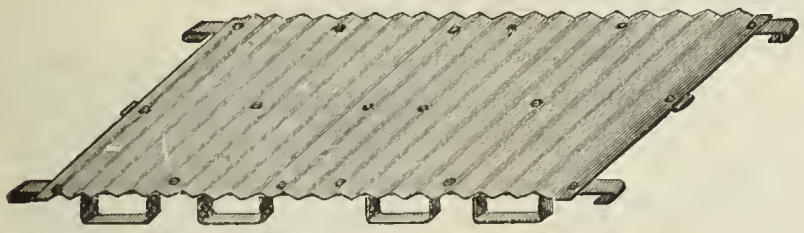
Patent Applied For.

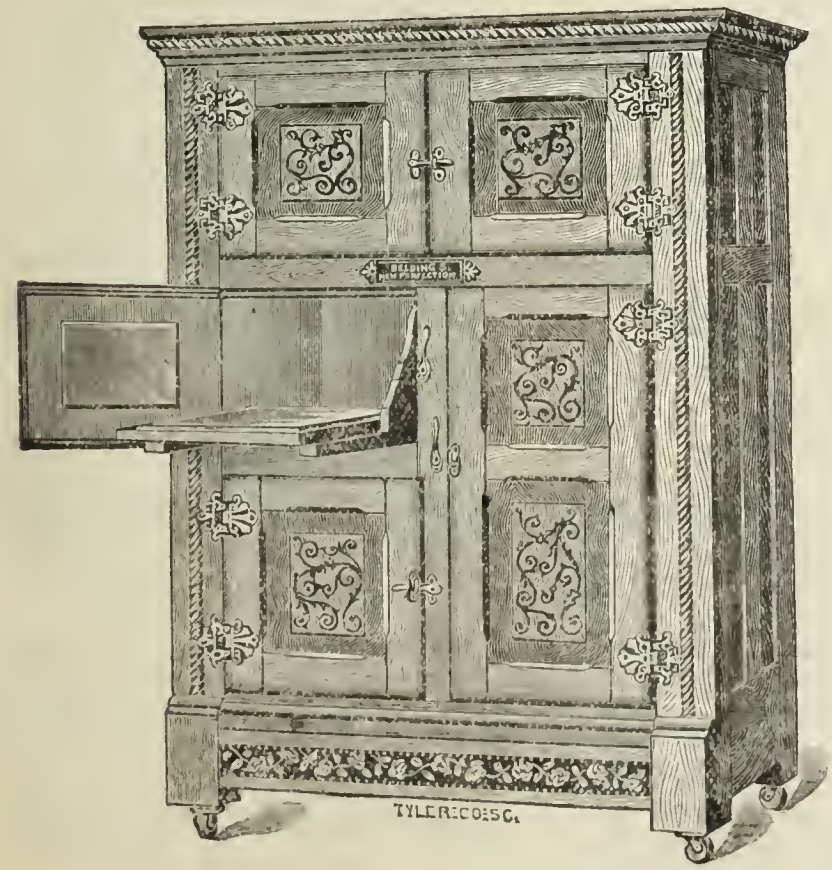
OUR NEW AUTOMATIC COLD AIR DAMPER ATTACHMENTS.



This cut shows a section of our Refrigerator with the New Automatic Cold Air Damper closed.

A—Represents Metal Ice Rack.
B—Bottom of Ice Compartment.
D—The **New Automatic Cold Air Damper.**
E—Door of Provision Chamber.

When the door of the Provision Chamber is opened the Cold Air Damper *immediately* closes the opening through which the cold air drops, thereby *instantly stopping the circulation* in the Refrigerator. Then, as the cold air in the Ice Compartment *cannot escape*, it is impossible for warm air to enter it through the flues in the sides of the Refrigerator; therefore, while the door of the Provision Chamber is open *no ice is wasted, no cold air escapes* and *no warm air enters* the Ice Compartment or *comes in contact with the ice.*



Thus it is clearly shown that this improvement is a *practical* one and makes our Refrigerators *consume less ice* than any that are now on the market.

OUR NEW DRIP CUP ATTACHMENT.

SOLID METAL ICE RACK.

No wood cleats to get water soaked and tainted.

All refrigerators **hardwood, antique finish.** We carry large stocks at all of the following places:

Challenge Iceberg Refrigerators,

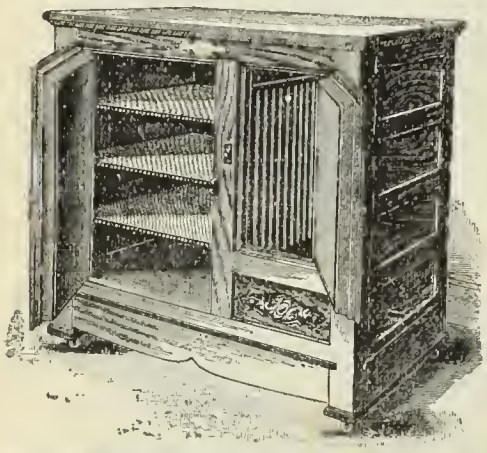
MANUFACTURED BY

The Challenge Corn Planter Co.,

GRAND HAVEN, MICH., U. S. A.

Write for our large Illustrated Catalogue for 1895.

All our goods are made of thoroughly kiln dried ash, finished in antique with Shellac and coach varnish. Panels are beautifully hand carved. Trimmings are of solid bronze and are our own pattern. We use our own patent air tight locks, patent self-retaining malleable casters and floor plates, and patent drip cups All Refrigerators are filled with pure charcoal. The Challenge Iceberg Refrigerators are the best made for preserving all articles stored therein pure and sweet, as there is always a circulation of pure, dry, cold air. Refrigerators having water coolers are provided with bronze faucet and cup holder. All Sideboards have a fine beveled French plate mirror. We manufacture Refrigerators of all sizes from the ordinary Ice Chest to the largest sizes for grocers' and butchers' use, including the most elegant line of Dining Room Sideboard Refrigerators ever put on the market.



THE CHALLENGE ICEBERG,

THE ∴ HONEST ∴ RELIABLE ∴ REFRIGERATORS,

SELL THE BEST.

The Automatic Refrigerator

has more good points and does better work than any other and for that reason is a better seller. Our illustrated catalogue for 1895 te ls all about the line. Its advantages are:

Perfect circulation.
Large condensing and purifying capacity.
It has no flues to cause it to smell bad.
The trap is inside where it cannot be misplaced or lost.
The drip pipe may be cleaned without disturbing anything in either chamber, and is entirely out of the way
It has nine walls to protect the ice and to maintain a uniform temperature in the cooling chamber.
It has woven wire provision shelves that are superior.
It has superior hardware.
It is more capacious and convenient.
Flavors of foods will not mix.
Last but not least, it's different, and will bring new customers and new trade.

We want the leading dealers to sell our goods and but one dealer in a place.
The goods are made of ash, and well finished.
We have two factories. one in the East and one in the West, and are able to take better care of your trade than if we had but one.

Accuracy.

Above all other elements in a workman's ability stands accuracy, without which all his work may go for naught. And yet, to many men quantity seems to stand before quality, at least to the extent that *almost* right is good enough. It is seldom that accuracy and extreme celerity go hand in hand. As a rule the accurate man, he upon whom one can always rely, is relatively slow. Nevertheless, when one compares his output of work which is always accurate with the net useful result of a lightning workman the balance is likely to tip in favor of the slow but sure method of doing things. Surroundings have certainly much to do with a man's ability to habitually turn out accurate work. In some establishments the incessant nagging and rushing, by unnecessary interference so upsets a workman that he is continually blundering. But there are other shops where, notwithstanding the fact that there is always a steady pressure to get work out, a man nevertheless feels that it must be right at all hazards.

Haste and Waste.

When the head of an establishment fully absorbs the idea that haste inevitably makes waste it will be seen that there is a way to get work out on time, to have it correct and to keep the workman in the best frame of mind to give his constant and undivided attention to his work. Accuracy on the part of the individual can certainly be cultivated, but nevertheless some men seem to be naturally far better equipped in this way than others. Acquired accuracy is a virtue, so to speak, of slow growth. It must, in fact, become a habit to be accurate, and, like all other habits, it must therefore be the result of repeated action. As each new job comes to the workman his determination must be that this particular job shall be just a little better, a little nearer perfect, than the last. He must see to it that no move is made until he knows that it will bring the desired result, that no piece is cut until it has been measured and that it is not laid aside until its thorough completion is rendered evident by careful inspection.

A Pompeian Bathroom.

A very interesting discovery recently made near the old site of Pompeii is described in the European journals. A large building was unearthed on the property of a Signor de Prosco, containing several rooms, among them three bathrooms, furnished with large sculptured marble basins, heating apparatus, lead plumbing work, with bronze faucets, and tiled floors and walls. The three rooms correspond in their arrangements w ith the usual hot, tepid and cold baths usually found in the old dwellings of the wealthy classes. This is, however, said to be the most complete, richest and best bathing installation so far found. It has been so well preserved on account of the roof not having caved in during the great eruption of Vesuvius, which buried the city of Pompeii in the year 79. Most of the houses were entirely destroyed at that time, only a few vaulted structures resisting the immense pressure of the lava and ashes. This roof is nearly 45 feet in length.

Another Gasoline Field.

The intense heat that can be secured from gasoline has made it useful in specially constructed fire pots for plumbers. As the early apparatus has grown in popularity a large number of new devices, all of similar character, have come into the field. With the gasoline furnace no heavy fire pot and large bag of charcoal must be carried by the plumber's helper, and no bin for fuel storage is required at the shop. In operation there is no shower of sparks to burn the carpet or curtains in a dwelling, or to start a fire among the refuse in a new building. No time is lost in starting a fire, and no disagreeable smoke made. With the furnace filled at the shop and tightly closed no leakage can occur to make trouble. Some of these furnaces are so made that they can be used as a torch to melt off old fittings or to get up a heat, and without them a plumber would in many cases be at a loss for some convenient means of doing his work. It is safe to say that the cost of plumbing has been reduced by their introduction. In some of the large cities, however, this indispensable helper of the suburban plumber is not used, either through adherence to past custom and blindness to its excellence, or owing to the prejudices of the insurance companies. Their entrance to this field will come, as their convenience is too great to be ignored, and the fact that they are used exclusively in both old and new work throughout the country is a sufficient guarantee against the supposed danger.

News and Notes.

Contracts are reported to have been signed for the elevation of the New York Central Railroad tracks in Buffalo, at a cost of $3,000,000.

Referring to the threat of Germany to shut out American provisions, Phil. Armour quoted the export statistics the other day on the cattle and beef trade, which show that nearly all the American cattle and dressed beef go to England. What goes to the European Continent is, in comparison, a drop in the bucket. Mr. Armour expressed himself as undisturbed by any apprehension on account of German embargoes.

The annual report of the harbor master of the port of Montreal, Can., for 1894 shows that the tonnage of the seagoing vessels which arrived there during the year was 1,096,909 tons—a decrease of 54,868 tons as compared with 1893; and the tonnage of the inland vessels was 979,809 tons—a decrease of 73,791 tons. There was also a decrease of 12,977,909 bushels in the exportation of grain.

The United States Consul at the Straits Settlements calls attention to the fact that Russian petroleum is supplanting the American product in that region. He says the Russian facilities for handling it are superior.

Nova Scotia's coal output in 1894 was 2,055,114 tons, an increase of 86,500 tons over 1893. Exports to the United States exceeded 120,000, an increase of 100,000 tons as compared with the previous year, due to the lowering of the tariff.

The Wyoming Petroleum Company have been incorporated at Cheyenne, Wyo., with a capital of $1,000,000, for the purpose of acquiring and developing oil lands in that State.

The Harland & Wolff Shipbuilding Company, of Belfast, Ireland, are reported to be in negotiation with a Liverpool company for the construction of two Atlantic liners, each to be 1000 feet long.

It is understood that the decision of the trustees of the Boston Franklin legacy to apply the same to the purposes of a trade school, pure and simple, will be adhered to. The trustees are said to be at present negotiating for the purchase of a suitable site for the school and considering plans for the buildings.

THE LETTER BOX.

Squaring the Circle.

From READER, *New York City.*—Please describe through the Letter Box of *The Metal Worker* the method of squaring the circle.

Answer.—A good many hard questions are asked of *The Metal Worker* and we try to answer them to the best of our ability. This, however, so far as we remember, is the first actually unanswerable question that has ever been propounded. To square the circle is to do what the mathematicians have been striving to accomplish for at least 20 centuries, and for how much longer we do not know. Squaring the circle, as technically understood, is finding the exact area of a circle. We can find it approximately, and so near in fact that the error is an infinitesimal quantity; but this is not mathematical accuracy. The difficulty heretofore encountered is that the relation between the diameter and circumference of a circle is an indeterminable quantity. The area of a circle is exactly equal to one-quarter the product of the circumference and the diameter. But the trouble is we cannot determine the length of the circumference from the diameter with absolute accuracy. The relationship is usually expressed by 3.1416, but that decimal can be extended without ever coming out even; in fact it has been worked out to over 100 decimal places. We trust our correspondent will, therefore excuse us for not answering his question. If any reader of *The Metal Worker* thinks he has solved this vexatious problem we shall be glad to hear from him.

Pattern for Fluted Cone.

From J. M. R., *Reading, Pa.*—Please inform me through *The Metal Worker* how to obtain a pattern for an article of which I send you a sketch. The idea is to start with a given diameter at the bottom and to die away to nothing at the top. Each piece to be cut to shape and raised.

Note.—The sketch given in our correspondent's letter shows a tapering helix in the form of a fluted cone. The work depends entirely upon raising the metal and the pattern cutting problem is not diffiult. The fluted pieces which are twisted in the form of a helix and are tapered at the same time are merely long strips of metal of triangular shape—that is, they start from a point at the top of the helix, and are of the width of the base of the flutes at the other end. If we have misunderstood our correspondent's inquiry we shall be glad to give it further attention.

Weight of Air.

From H. T. G.—Please inform me what is the weight of a cubic foot of dry air at 5°, 10°, 15°, 20°, 25°, 30°, 35° and 40° below zero?

Answer.—As a result of experiments made by Biot and Arago, it was determined that 100 cubic inches of dry air, with the barometer at 30 inches, and the thermometer at 60° F., weigh 31.074 grains. Then 1 cubic inch of air would weigh 0.31074 grain. As there are 1728 cubic inches in a cubic foot, $0.31074 \times 1728 = 536.958+$, or nearly 537 grains of dry air in 1 cubic foot, according to the above conditions. Thus 1 cubic foot of air under ordinary circumstances weighs about 1¼ ounces. As a rise of temperature of 1° F. causes air to expand one-four hundred and eightieth of its bulk, 1 cubic foot of air would be one-four hundred and eightieth part lighter for each degree of rise in temperature. Accordingly we can consider that 1 cubic foot of air would be one-four hundred and eightieth heavier for each degree the temperature was lowered, being under the same conditions. By dividing 536.958 grains, the weight of 1 cubic foot of air, by 480, the quotient, 1.118+ grains, is the increase in weight for each degree the temperature is lowered. As we wish first to obtain the weight at zero, we multiply 1.118 by 60, and add the result, 67.08, to the weight 536.958; the sum of the two is 604.038 grains. As 1.118 grains is the increase in weight for each degree the temperature is lowered, $1.118 \times 5 = 5\ 59$, the additional weight for each 5°. As a matter of convenience we may consider the weight of 1 cubic foot of air at zero to be 604.04 grains, and that 5.6 grains are to be added for each 5° the temperature is lowered. According to the above calculations the weight of 1 cubic foot of air at the temperatures given would be as follows:

604.04 grains at zero.
609 64 grains at 5° below zero.
615.24 grains at 10° below zero.
620 84 grains at 15° below zero.
626.44 grains at 20° below zero.
632.04 grains at 25° below zero.
637.64 grains at 30° below zero.
643.24 grains at 35° below zero.
648.84 grains at 40° below zero.

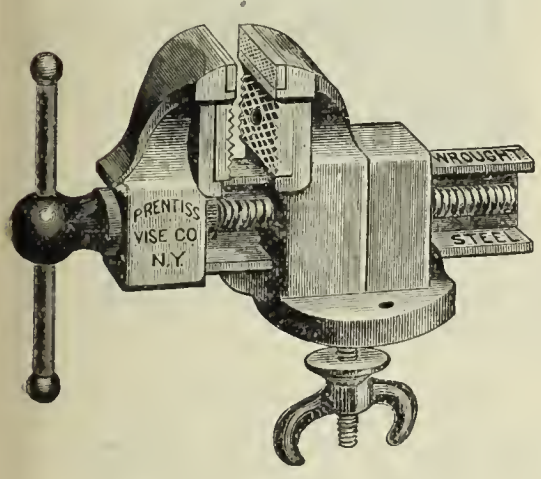
As the above are supposed to be Troy grains, and as there are 7000 Troy grains in 1 pound avoirdupois, $7000 \div 16 = 437.5$ grains per ounce avoirdupois. Then at 40° below zero the weight of a cubic foot of air, under the conditions above named, would be 648.84 divided by 437.5 grains, or 1.483 ounces.

Condensation Under Iron Roof.

From J. D. S., *Fredericton, N. B.*—As I have always been benefited by the information contained in the Letter Box, I now ask *The Metal Worker* to assist me in my present difficulty. Last fall we put a galvanized iron roof on a building 40 x 100 feet, having a pitch of about ¼ inch to the foot. The roof was laid with tongued and grooved boards, and covered with tarred paper before we put on the galvanized iron, which was No. 26, and put on over a wooden roll, the seam being on top. The cross seams were well grooved and soldered. We did not have any trouble from leaks during the heavy fall rains, nor until cold weather set in, when we had a spell of soft weather. There was about ½ inch of snow on the roof when it began to drip in several places. The building is of brick, four stories high, and the upper stories are used for storage and are not finished. Would the building, being just finished and consequently not thoroughly dry, cause the dampness? We have laid several roofs like the above mentioned and have had no trouble from them, but the buildings are all finished inside, being lathed and plastered under the roofs. What is best to do to stop the "leaks," which to my mind are caused by condensation?

Answer.—As there was no drip or leak from the roof during heavy rains, it would indicate that the seams did not leak. Such being the case, it would appear that our correspondent was right in supposing the drip was caused by condensation. However, as it is possible that the subsequent cold weather may have caused the roof iron to contract sufficiently to crack the seams, it might be well to give the roof a thorough inspection. When a building is provided with a metallic roof which is so arranged as not to prevent moisture from coming in contact with its under surface, and when the weather is sufficiently cold, the moisture evaporating from the building coming in contact with the surface of the roof covering is sometimes condensed in such quantities as to run along the roof boards until an opening is found, and drips upon the floor below. The obvious method of stopping this condensation is to prevent the moist air from coming in contact with the roof. This might be accomplished by covering the underside of the joist with building paper or lath and plaster. If this cannot be done, it might be well to place ventilators in the roof so the evaporation from the building can be carried off. This latter plan has often been followed with success. We would be glad to have suggestions from our readers.

Flux for Soldering Zinc.



From J. S. Z., *Richmond, Ind.*—Is there any other flux besides acid diluted with zinc which can be used successfully for soldering zinc, thus doing away with the discoloration of work after it is finished? If any of your readers know of a substitute which will not have this effect on finished zinc work I will be pleased to have them tell me what it is through the Letter Box.

Wanted, Show Window Suggestions.

From W. S. L., *New York.*—I am a young tinner who is looking for something to work at during the long winter evenings. I have already made a couple of models which have been used successfully for window display, and I am now looking for some other notion to work on. I would be very glad if the readers of *The Metal Worker* could help me with suggestions in this line.

Prentiss Improved Pipe Vise.

Prentiss Vise Company, 44 Barclay street, New York, have brought out an improved combination pipe vise, as

Combination Pipe Vise.

here illustrated. The main feature is the sliding bar, made of wrought steel, which is a decided gain in tensile strength compared with the cast iron part which is superseded by it. This detail, it is claimed, adds much to the life of the vise. The steel plate pipe jaws or grip plates used with this vise are, it is stated, made of the best steel, carefully tempered. They are deeply serrated at right angles, forming innumerable points. The plates are reversible and interchangeable and full width of the vise, thus giving greater holding contact, with, it is pointed out, much less pressure on the pipe than with the old style concave jaws.

In a recent communication to the Mining Society of Nova Scotia, C. E. Willis states that the district near the eastern coast of Port-au-Port Bay, Newfoundland, is seamed in many places with asbestos. He says that the metamorphous rocks and serpentines of Quebec dip under the Gulf of St. Lawrence to reappear on the western coast of Newfoundland, and extend probably across the island. Only surface work has been done so far, but the asbestos fiber is claimed to be of good quality, up to 2½ inches long, and practically identical with the well-known Canadian product.

The Odorless Steel Sanitary Dump Cart.

The cuts shown herewith represent a steel dump cart, offered by the United States Sanitary Company, 618 Pennsylvania avenue, Washington, D. C. The cart is described as having a body made of the best flange steel, thoroughly riveted, and provided with a built up axle, which enables that portion of the axle that passes through the body to be incased in a steel boiler tube, expanded at the ends, and as having all joints air and water tight. There are two lids or doors, one at the back and one at the front, for greater convenience in loading, these being made with deep flanges, to close as tightly as possible. It is explained that the lid at the rear is operated by a spring handle on the side of the body, which works easily, the lid being locked in any of three positions—shut, half open for loading, or open all the way for dumping. The distance from the ground to the top of the tank or body, when the tank is level, is 4 feet 4 inches, and, if desired, for easy loading the body can be adjusted at an angle which will bring it 2 feet lower. The lids covering almost the entire top makes it possible to load the cart at either end, thus filling the body full. It is stated that the dumping gear is so arranged that when the cart is fully loaded it can be dumped completely by a boy; and that when it is desired to clean the cart after emptying, by opening the lids and adjusting the body to the desired angle it is possible to reach and thoroughly wash the interior in every part. In construction either the Archibald iron hub, the plain wood hub, the Warner or Sarven wheel is used, as may be desired. It is stated that the axles are entirely of steel, and are all to standard size; that the castings are of gray iron, steel and malleable iron, and that the axle nuts, boxes, arms, spindles and drops are interchangeable, so that they may be renewed at small expense and with little labor. It is remarked that the carts are painted in attractive colors, lettered if desired, and that they are varnished with good, heavy coach varnish, presenting an attractive appearance because of their superior finish. The point is made, that by using a high wheel and having the body low on an even balance, one horse can readily handle the large cart when loaded with garbage to its full capacity. Two sizes of carts are made, the only practical difference being in the size of the body.

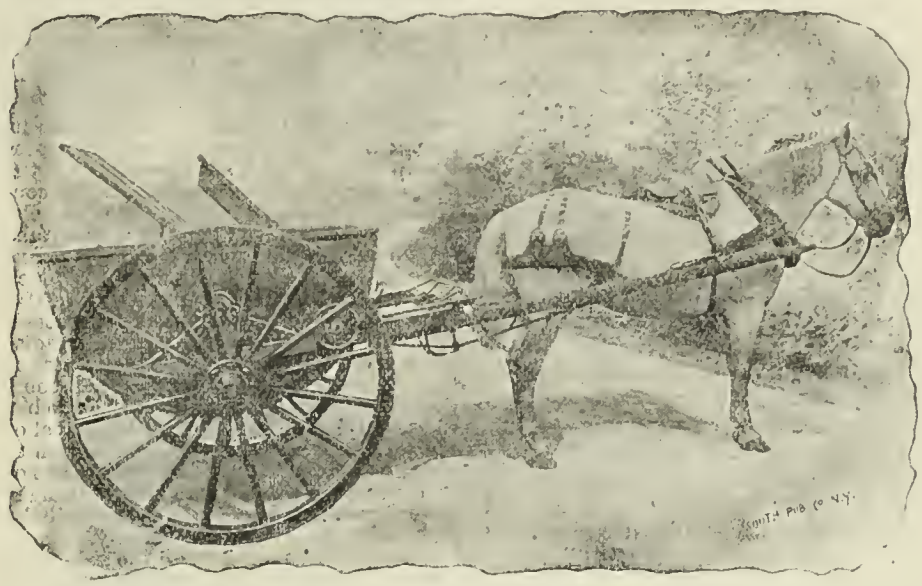


Fig. 1.—The Odorless Steel Sanitary Dump Cart.

Fig. 2.—Cart in Dumping Position.

The large cart has a capacity of 54 cubic feet and weighs, empty, about 1500 pounds. The small one has a capacity of 37 cubic feet and weighs, empty, 1300 pounds. The company remark that their aim is to produce, at a reasonable price, a vehicle of the highest grade, that will do its work in the easiest and most efficient manner. The carts are designed for handling garbage, night soil, material from sewer inlets, street sweepings, lime, mixed mortar, &c. The company advise us that they will be pleased to correspond with cities, towns, corporations or firms desiring to put the carts in service, and that they will gladly quote prices or give any desired information.

PLUMBING and GAS FITTING.

Newark, N. J., Plumbers.

The first annual concert and ball of the Master Plumbers' Association of Newark, N. J., was held in the Krueger Auditorium on January 15. The Auditorium has a fine dancing floor, a handsome stage, where the Voss orchestra discoursed a select musical programme, and along each side are balconies with the space below inclosed by a railing for spectators. The Committee of Arrangements—Wm. Jacob, F. J. Sturn and Jacob Rau—had a pretty propramme of the dances distributed during the grand march, which was led by Nathan Steiner and Miss Schaeffer.

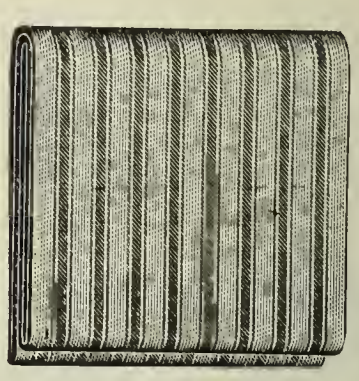
The gathering wss notable for the number of handsomely costumed ladies who gave grace and beauty to the occasion and were quite the feature of it.

H. V. Ammermann, W. Zeliff and Charles Geissle were the Floor Committee, and the dances were liberally patronized. The Reception Committee were Elias Berla, Charles E. Bond, E. J. Leonard, Jos. A. Smith, C. Sullivan, Walter P. Dunn, Franklin B. Sandford, James C. McGuire, R. J. O'Crowley, Francis Lang, Chas. B. Zimmerman and Ira Budd. Among the guests were State Vice-President John Hickman, Levi McBride, J. T. McNabb and Jas. Kearney of Paterson, L. J. Parks, Geo. W. Plastow, National Executive Clerk W. E. Crosby, Alexander Don, C. P. Vanderveer, G. F. Hickmot, J. Conover, R. Doremus, Wilbur Doremus, T. H. Hoover and a host of other friends of the members with their ladies. During the evening an intermission was called when all marched to the banquet hall, where an elaborate *menu* was served in excellent style. At the close of the banquet President Berla made some happy remarks, among which was the statement that plumbers were better men on account of having better halves, and added that the evening of the entertainment was honored in being the anniversary of the birth of Mrs. Wm. Jacobi, to whom he had the pleasure of presenting a basket of beautiful flowers in behalf of the association. On leaving the banquet hall dancing again became the pleasure of the hour until the gathering dispersed with happy recollections and kindly wishes for the Newark plumbers.

Master Plumbers and Knights of Tabasco.

We have received the following letter from James F. Davlin, president of the Somerville Association of Master Plumbers, on the action of the National Executive Committee *vs.* Knights of Tabasco:

I write to express my approval of the article in your recent issue from our honored national president, John Mitchell, wherein he very politely, yet forcibly, advises the Knights of Tabasco to refrain from attending the national conventions of the master plumbers in the future:



I admire the gentlemanly manner in which President Mitchell voices the sentiments of the National Executive Committee and many members of the last convention in Detroit, myself among the number, and while I do not care to add anything to what Mr. Mitchell has written, I believe it would be much better if the delegates to the national gatherings were left wholly to the local society with such provisions as are usually made by the national body while attending the convention for such pleasures as may be practicable after the labors of the convention are ended, but while the convention is in session I hold that the delegates who attend to their duty and take such interest in the proceedings as is necessary for an intelligent discharge of such duty, will be benefited far more by a restful evening between sessions and better fitted, physically and mentally, to consider, discuss and dispose of the many questions of great interest to the craft which will come before them for action. My experience has taught me that from the time the gavel of the presiding officer calls the convention to order until it falls to announce the close of the proceedings, every moment is fraught with interest and responsibility to the delegates, individually and collectively. Therefore, I say that it requires all the mentality of all the delegates in all its strength and vigor to properly perform their duties. While I recognize the good intentions and genial motives of those generally good fellows—the Knights of Tabasco—I agree fully with President Mitchell and the members of the Executive Committee in the advice given to the knights *anent* our national conventions, and I hope to hear from every quarter of the country where master plumbers are organized a hearty approval of the wisdom of our national officers. I am not going to say one word about the (in my opinion) hasty and injudicious communication of the "Old Pepper," other than to remark that he has got himself in a pickle.

Modern Plumbing Regulations

The old plumbing regulations of New York City do not cover the advance made in plumbing practice and material, and in the Department of Buildings this is recognized. Superintendent Thomas J. Brady has had prepared new regulations for lighting, ventilation and plumbing, and they are now under consideration. This step has been necessary to meet the rapid progress that has been made in these trades. Wrought iron or steel pipe has come largely into use in the recent past, and in some cases lighter pipe than is desirable has been employed. The different weights and grades have been investigated and only a heavy pipe of the best quality will be recommended by the department. Brass pipe also is more largely used in plumbing work than heretofore, and pipe of the caliber known as iron pipe sizes is the only kind that will come up to the standard of the department. It is known that some of the brass thimbles, solder nipples, &c., formerly used, have been of very low grade metal and very light, so that it was difficult to tin them and wipe a proper joint, and in calking a joint with one of these ferrules, to make a soil pipe connection, they frequently caved in or assumed an irregular form, making a tight and perfect union almost impossible. The investigations of material have been exhaustive, and in consideration of the best interests of all from a sanitary standpoint the recommendations are for a high standard. The same character of investigations and recommendations have been made in reference to lighting and ventilation. These steps are in the right direction, and the matter is now receiving consideration as to its final disposition.

Columbia Wiping Cloth.

The illustration of the wiping cloth presented herewith shows a cloth that is being sold by the J. W. Chamberlain Company, Bangor, Me. The cloth, the makers advise us, is made under the personal supervision of a plumber of more than 30 years' experience, and its particular features of merit are alluded to. The cloths are made of special

Columbia Wiping Cloth.

ticking and have, we understand, been used with the most satisfactory results by plumbers.

Wisconsin Plumbers.

Last week 75 plumbers from all parts of the State met at the St. Charles Hotel, Milwaukee, Wis., and formed the Master Plumbers' Association of Wisconsin. L. H. Plum, president of the Milwaukee Master Plumbers' Association, opened the meeting and made an address of welcome. State Vice-President W. H. Halsey of the National Association of Master Plumbers received the new organization into membership. Forty-eight firms from the State at large were represented. They were as follows: Joseph Callahan, Green Bay; George Kraft, Madison; Anton Metz, Madison; O. K. Patterson, Stevens Point; J. P. Wray, West Superior; Louis Sontag, Sheboygan; William Hardeker, P. J. Dullanty, Ashland; H. L. Larsen, Manitowic; R. C. German, Janesville; Behrens & Reeke, Sheboygan; Charles Heeskelar, Eau Claire; William Lekland, Sheboygan; W. Goddard, Oshkosh; Murphy & Fredel, Fond du Lac; O A. Jones, Oshkosh; G. L. Krause, William Brechtel, Sheboygan; Thomas F. Delany, John F. Lee, Wausau; Thomas & Anheiser, Nelson Skog, Green Bay; Anton Breheme, Fort Howard; A. B. Taylor, Fond du Lac; John Wahler, Duncan McTavish, Harry Morris, H. Raymond, Coffee & Williams, Racine; J. P. Fox, Eau Claire; David Ahron & Son, Fond du Lac; Stack Bros., Burnett & Son, West Superior; C. S. Gregory, Beloit; W. S. Patterson, Appleton; A. F. Shoenoff, Menomonee; Neil & Co., West Superior; A. V. Fetter, La Crosse; P. H. Ryan, Appelton;

George B. McCall, Chippewa Falls; Charles Hewlett, Racine; James A. Trane, William Wenzel, Appelton; J. H. Case & Co, Green Bay; Jackson & Longthorn, Kenosha.

After appointing committees on Constitution and By-laws and Resolutions the following officers were elected:

President, P. H. Ryan, Appleton.

Vice-president, George B. McCall, Chippewa Falls.

Secretary, W. S. Patterson, Appleton.

Treasurer, Charles Hewlett, Racine.

Sergeant-at-arms, John D. Jackson, Rhinelander.

The following committees were appointed:

Constitution and By-laws: J. P. Fox, C. S. Gregory, John F. Ahearn.

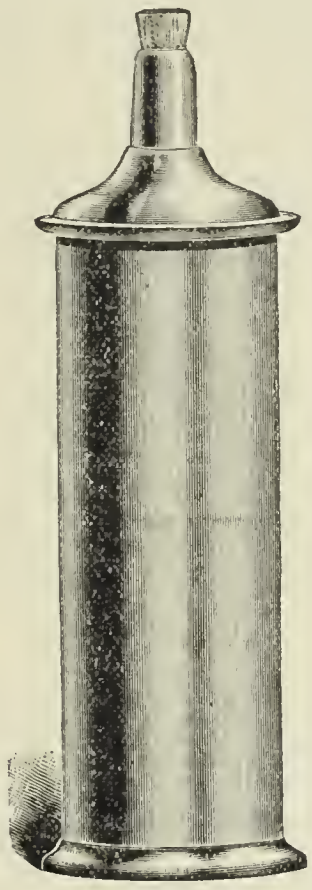
Resolutions: Louis Sontag, William Hardecker, O. K. Patterson.

The association will favor a bill at the coming session to appoint boards to license plumbers and supervise the business of plumbing. The bill creates a board of examiners in every town of 5000 inhabitants, consisting of the chairman of the Board of Health, the building inspector and a third member who shall be a master plumber, who shall be appointed by the mayor and be allowed $5 per day for actual service. These boards shall license applicants who are deemed competent, at the rate of $2 for master plumbers and 50 cents for journeymen plumbers. The bill also provides for an inspector of plumbing in every city of 5000 inhabitants. The bill provides that the common councils of cities of 5000 shall pass rules for materials, construction, alterations and inspection of pipes, faucets, tanks, valves and fixtures, which shall be binding on all builders, under penalty of $50. It was decided to hold the next annual meeting in Racine January 9 and 10, 1896. George B. McCall of Chippewa Falls, J. P. Fox of Eau Claire and President Plum were selected as delegates to the National Association of Plumbers in Philadelphia, June 5 and 6, 1895. Before adjournment the convention passed a vote of thanks to the Milwaukee local association for courtesies received.

The Milwaukee Association entertained the delegates with a theater party and a banquet.

Scranton Plumbers Organize.

A meeting was held by the master plumbers of Scranton, Pa., in the rooms of the Builders' Exchange last week, for the purpose of forming an association. This movement was brought about by James F. Traynor, president of the Master Plumbers' Association of Wilmington, Del., who was appointed by National President John Mitchell for the work of organizing new associations.



William Stephens, a prominent member of the Wilkes-Barre Association, was also present. There was a large attendance of the local plumbers, and they were all enthusiastically in favor of organizing and every man who had not a pressing business engagement attended the meeting. The officers elected are:

President, H. J. Gunster.
Vice-president, Thomas Mullen.
Secretary, John J. Gorman.
Treasurer, John J. Howley.

L. H. Tillinghast & Co., Providence, R. I., dealers in plumbers' supplies, have been incorporated as the L. H. Tillinghast Supply Company.

Handy Pocket Torch.

Kendrick Valve & Washer Company, Syracuse, N. Y., manufacturers of pump valves, plungers and specialties for plumbers' steam fitters' and tinsmiths' use, are offering a handy and useful torch for this class of mechanics. It is designed to supersede the candle, giving a much better and safer light, with none of the candle's untidy characteristics. It is 4 inches long and 1⅛ inches in diameter. The tube is filled with cotton to be saturated with gasoline or oil, and a wick placed in the tube, which is covered with a cap. The bottom is fitted with a screw cap which

Pocket Torch, Full Size Cut.

can be readily removed for filling. The torch is polished and nickeled. When not in use the burner is covered with an extinguisher or cap.

Benefits from Organization.

Many of our readers will be interested in the following letter from John Mitchell, president of the National Association of Master Plumbers:

A short time ago I received from an association organized but a few months previous to the last national convention an inquiry as to the benefits derivable from membership in an association. So much has been written on the subject by able writers, who have had the interest of the association at heart and whose official positions enabled them to write intelligently on the subject, that the query appeared to me extraordinary. I can but voice the sentiments heretofore expressed. A "Philadelphia plumber" has offered some timely advice on the proper selection of local officers. Ex-President Hannan has written on "The Benefit of the National Association," while an energetic secretary of a new thriving association located outside of our domain—J. W. Hughes of Montreal—has declared that "even the very plumbers have a soul to be saved." However, it may not be out of place at this season of the year, when associations are starting in on a new year of either success or failure, for me to give the lukewarm associations a few hints as to what beneficial results may be secured by a properly conducted master plumbers' association.

Judging from the tone of some of the letters received at this office, there is an apparent lack of interest manifested by both members and officers of some local associations. To continue on without overcoming this feeling of unconcern in self-preservation, or associated existence with inimical relations between members, is, I must frankly admit, a useless expenditure of time and money. An association can be a success only so far as each member contributes his influence in making it so.

FORTUNATE ASSOCIATIONS.

There may be communities of plumbers so fortunate as to have no need of associated harmonious action. They may be so friendly, one with the other, that they speak as they pass; will impart to a fellow craftsman a bit of information—"I hear you are going to do some work for Mr. Neverpay. Well, 'old fellow' you are most welcome to his trade. I refused to do any more until he paid up. I hope he will not cheat you," and will refuse to do work for a party when a member has not been paid. If this kind of fellowship prevails in your city you have reached the acme of perfection. Manufacturers may be selling only to the trade in your city. If so, pause for a moment and consider what influence wrought the change, for did it exist before the formation of the National Association? If you feel that you have secured all these benefits from your association and affiliation and that you can no longer afford to support the grand national organization, silently offer thanks to those who have spent time and money in the elevation and protection of our craft. Do not be so ungrateful as to now question the association's influence for good. You can render to your less fortunate fellow members an invaluable service by lending your influence to the cause and imparting to them the secrets of your success.

LUKEWARM ASSOCIATIONS.

If on the other hand there are associations that feel there is a chance for improvement, which I mistrust exists, I respectively dedicate to them these words with the sincere hope that they may incite them to renewed and well directed efforts.

"LIVE AND LET LIVE."

In these days of sharp competition considerable rivalry among master plumbers prevails in localities, and it is to be deplored that it sometimes reaches enmity; operating to the detriment of all, and especially disastrous during general financial depression, when instead of pursuing the policy of "the dog in the manger," making nothing yourself nor allowing your neighbor the chance, you should have done as has been done in some associations—"live and let live." Or reversing the phraseology of the terse maxim: Allow others to live and they will do likewise.

I have found the feeling of antagonism so great in localities that actually one plumber would go on the other side of the street rather than meet his neighbor in the same line of business. And for what reason? In the majority of cases simply because he has met you in what should be honorable competition—figured on a job too low, secured it, and then has done what you would have done from necessity: slighted the work and substituted material where possible. Then what have you done? Taken means to have the owner informed that your competitor has done so and so. What is the result of all this? The owner or builder, to say the least, makes it disagreeable. He may refuse to pay. Your competitor is compelled to sue and jeopardize the motive actuating him at first; that is, if he could once do the work, he would in the future have the preference from that owner. It is most pleasing to note that there are many master plumbers above this kind of rivalry. They can be picked out, as they have always work at living prices. The supply houses know them, for they can promptly pay their indebtedness. But there are many who might be likened unto the dog in the manger who could not eat hay, but nevertheless jumped into the manger, biting and starving the horse.

A GOOD FOUNDATION.

Before you can expect to inaugurate reform you must first have a good foundation on which to build. It is as truly essential that the underlying principles, the stability and unity of the association, should be strong, as it is that the foundation of the building should be solidly constructed; otherwise, it is like a "house built upon the sand," the first wave of dissension causes destruction. Before attempting to carry out measures for the aggrandizement of members sheathe the knife you

have carried up your sleeve so long and be ready to greet your fellow member cordially, show him by your action that you trust him and he will soon learn to trust you. Have a good word for him and he will remember you kindly.

While dictating this paragraph a business man came into my shop, exclaiming : "My wash bowl has given out." Without giving me a chance to inquire the cause he anxiously volunteered the information, which he supposed would make me happy —"The plumber who put it in was a fraud." The countersunk piece in the bottom of the bowl, connecting with the plug and coupling, had pulled out. I said : "It is not the fault of the plumber, but an unforeseen flaw in the bowl." He looked astonished that I disagreed with him; but do you think he would have had more confidence in me had I agreed with him in denouncing a neighbor's work?

Let it be written in your constitution that you will do unto others as you would wish others to do unto you. I fancy my readers smiling at the Scriptural injunction as impossible, and each saying, "I would do it, but the other fellow would not." That is the trouble—distrust. There is an association that has made this injunction rather obligatory by means of a fine for a violation of the principle. Means are adopted to collect the fine. One way is expulsion, which means forfeiture of offender's share in the treasury, containing several thousand dollars.

THE WAY TO BE BENEFITED.

It very frequently happens that bills are brought in for criticism, the recipient expecting that he will be assured of the exorbitancy of the bill and receive a hint that had he patronized the "only practical" plumber he would not have been thus annoyed. I call to miud a large association that has adopted a schedule of prices to obviate this practice, and which has given satisfaction. If the bill is brought in for denunciation the plumber looks it over, and if in accordance with the schedule says, "It is the same as I would have charged." Try it and you will never have some customer say you have robbed him, and as a result lose his trade.

Agree to finish no work for an owner on which a member has been employed and for which he has not been fully paid. Sometimes a settlement cannot be secured by reason of alleged inferior workmanship or a non-compliance with an architect's whim. It may be owing to a failure of the owner or builder. The failure of a plumber to get his pay means his inability to pay the supply man. The supply men realize this and will assist you. Try this, and you will find that each member has a great financial advantage over non-members.

Agree to sell no goods you do not put in, and then members of the craft will never have a customer say, "I have some goods which I waut you to put in." An instance came to my notice a short time ago where a city plumber sold some material to a suburban resident, who went to his local plumber to have the work done. The local plumber was a member of the National Association, and supposed he had a clear case against a dealer, but found that some brother plumber had wrouged him. Adopt this rule and you will have less complaints to make.

Agree to put in no material that you do not furnish, for you can't afford to guarantee goods that you do not buy. A strict compliance with this rule will teach owners who have plumbing to do that it is to their advantage, with regard to sanitation and cost, to deal with the plumber exclusively.

Did you ever contract to do a job, and a little later be informed by your journeymen that they must have an increase in wages, which you could not afford to give, as you had figured on a certain rate? Too much importance cannot be laid upon the beneficial results of harmony betwecn employer and employee. Conference committees I have always found to be most satisfactory. In some cases unwarranted ruptures have occurred ; conference committees have been discharged and conflicts have followed, where, had the pleasant conference relations existed, disputes might have been amicably adjusted without recourse to strikes. I hope for the time when all associations will have a regular conference committee to meet with the journeymen, and theu all master plumbers will know in advance what wages they are to pay.

Can you reckon the monetary value to be derived from each one sincerely following out the above suggestions, each one of which has been successfully pursued in several sections?

AFFILIATION WITH THE NATIONAL.

But little explanation is needed with regard to affiliation with the National Association, The Baltimore resolutions are known from the Atlantic to the Pacific. There are many complaints of alleged violations, but the records of this office show that 90 per cent. of the complainants have been unable to substantiate their charges. Cases have occurred where it was apparent that the manufacturer had sold to the consumer. Little indignation meetings have been held, and committees appointed that have found that the supposed faithless manufacturer held an autograph order from a master plumber to deliver goods to a consumer; thus signing away his rights to the detriment of himself and associates. It is this class of plumbers who are the loudest in their denunciations.

One member came into my shop a few days ago denouncing the Baltimore resolutions, and come to find out he had never read them over, and, therefore, did not live up to them.

CAN YOU ATTEND TO LOCAL COMPLAINTS?

There are many petty complaints which local associations can adjust with more rapidity than the National, because of distance and meager information. Many associations are able to adjust complaints today, but if they stood alone and did not have the representative master plumbers throughout the country to espouse their cause and act in case of failure, could they succeed?

It is not a strange occurrence to get no more information in a communication than the following: "Mr. Smith of this city has received a shipment of goods from Mr. Dealer. Attend to it promptly." If you write for further information you may not receive a reply, or if you are so fortunate you are liable to be accused of asking for useless information in order to indefinitely postpone action, or you may be accused of presuming to doubt the correctness of his statement.

THE NATIONAL READY.

The National Associatiou is ready at all times to assist locals in the amicable adjustment of all violations of the protective regulations. It is not the fault of the national officers that some associations do not receive what they call "the worth of their money."

The lukewarm association might be likened unto a patient, and the National a physician. If the physician prescribes medicine and treatment for the recovery of the patient and the patient has no faith in the advice and medicine, partly carries out the instructions, or, as sometimes happens, does not carry them out at all and does not use the medicine because it is a little inconvenient, and does not recover, or what is more likely grows worse, who is to blame, the patient or the physician?

TRAPS AND VENTS.

John Murray and F. H. Close have formed a partnership in the plumbing line under the name of Murray & Close, at Jackson, Mich. Mr. Murray is well-known in that city, having been a plumber there for 40 years. Mr. Close has been connected with the Michigan Heating & Plumbing Company since their inception.

Fred. W. Gore, who has been with the Chippewa Falls Plumbing & Supply Company and their predecessors for six years, is opening a plumbing shop of his own at 108 West Central street, Chippewa Falls, Wis.

From one who has had experience comes the statement that when seamless drawn brass tubing is used where there are great changes of temperature, it should be ordered slightly annealed. Tubing that has been drawn by several processes under heavy pressure has at times shown a tendency to become brittle in places; then owing to the unequal expansion and contraction in the hard and soft places under a change of temperature, it has been known to split or crack. To prevent such a contingency a slight annealing has been found all that is necessary. Piping for hot water service is likely to have a change of 100° in a short time quite frequently; but it is said if the pipe is properly annealed no disagreeable results may be expected.

The Executive Board of the Master Plumbers of Connecticut met in the Hotel Russwin, at New Britain, Conn., last week. The business of the year was balanced and preparations were made for the annual convention to be held in Waterbury, February 6. Those present were John Ahearn of Hartford, J. B. Weiant and J. S. Stone of New Britain, S. E. Dibble of New Haven, C. S. Eames of Bridgeport, John Stevens of Hartford and Messrs. Disley and Barrow of Waterbury.

A new plumbing firm have been organized in Lafayette, Ind., to be known as Seagraves, Cochran & Co., who have absorbed the business of Sheehan & Co., and are established at 134 East Main street. The firm are composed of D. C. Seagraves, who has been with Wallace Bros., and W. F. Cochran, who has been with the O. P. Benjamin Company, and W. L. Sheehan, the senior of the late firm of Sheehan & Co.

The H. Mueller Mfg. Company, Decatur, Ill., issue an eight-page circular of Mueller's patent stop and waste cock, showing the many different convenient forms in which it is made. It also shows the Mueller patent basin clamp, which suits any thickness of basin, and, it is said, cannot slip.

The Board of City Record of New York has ordered the issue of 400,000 circulars to householders, giving sanitary instructions. The circulars will be distributed by the police as soon as they can be printed.

The master plumbers of Waterbury, Conn., held a meeting last week in the Board of Trade rooms and began their arrangements for the annual convention of the master plumbers of the State, which will be held in that city, in the City Hall, on February 6. The convention will be the fifth annual and the address of welcome will be made by Mayor E. G. Kilduff. The following committees were appointed: Reception, W. E. Disley, M. J. Daly and Patrick Garrity; Music, W. E. Booth and Edward Casey; Finance, Edward Casey and William Minor; Printing, Robert Walker. After the convention, the delegates will be banqueted at the Scovill House.

Some discussion is going on at Toledo, Ohio, over the water works trustees selecting two water meters from which to make a choice, instead of letting a consumer select any meter he prefers.

John Brady has opened a plumbing shop on Gold street, Bridgeport, Conn.

C. F. DeVennish, City Inspector of Plumbing and Drainage, at Columbus, Ohio, has submitted his annual report to Health Officer D. N. Kinsman, by whom it has been approved. The inspector bears very strongly upon the necessity of issuing plumbing licenses to master plumbers and journeymen who are competent in every respect to do the work and requiring them to pass rigid examinations in the rules and regulations as established by law. Thousands of dollars are expended in beautifying buildings, while the sanitary appliances do not receive the consideration they deserve. Following is part of the work to which the report refers: Inspection

new plumbing work in new and old buildings, first and second inspections, 273; new work not accepted until plumbing rules were complied with, 37; changes ordered in sewerage and drainage, 48; owners notified of work not approved, 15; defective plumbing ordered remodeled, 18; defective plumbing repaired on complaint, 93; buildings, public and private, inspected, 218.

A MASTER PLUMBERS' ASSOCIATION has been organized at Allentown, Pa., and the following officers have been elected: President, J. H. Birchall; vice-president, J. C. Bitterling; secretary, August Leibold. This association will be affiliated with the National Association of Master Plumbers.

THE CODY PLUMBING COMPANY succeed the Cody-Hineline Company at Minneapolis, Minn.

HUGHES & BROOKS succeed John F. Hughes in the plumbing business at Little Rock, Ark.

FIRE, on January 12, destroyed the plumbing shop of Rogoski & Dungan, Little Rock, Ark.

THE MASTER PLUMBERS of New Hampshire met in Manchester recently and discussed the feasibility of advocating a State law controlling plumbing.

SAMUEL MCFARLAND has been engaged by Peck Bros. & Co., New Haven, Conn., to visit the architects and plumbers in New York in the interest of their line of sanitary specialties. They have a fine showroom at 16 East Twenty-third street, New York, under the management of C. M. Coleman.

MAYOR HENDRICK of New Haven, Conn., has appointed Dr. Joseph F. Townsend and Samuel E. Dibble to serve for three years on the Board of Health. These appointments are highly commended by the *Evening Leader* of that city. Mr. Dibble is well known to the plumbing trade throughout the country and his appointment will be gratifying to them. It is a matter of regret that there are not more master plumbers of Mr. Dibble's kind appointed on health boards throughout the country.

THE CHICAGO MASTER PLUMBERS' ASSOCIATION will hold their annual reception and ball on the 30th inst., at the Auditorium, having secured the banquet hall for that purpose. The arrangement committee consists of Paul Redieske, Thomas Conway, P. Sanders, Alexander W. Murray, G. A. Larson, T. P. Culloton, P. M. Murphy, C. C. Breyer and J. B. Breen. The annual ball is always an important event with the Chicago plumbers, being much more of a social occasion than balls usually are. This will undoubtedly be a most enjoyable gathering.

THE BROADWAY PLUMBING COMPANY have been incorporated in St. Louis with an all paid capital stock of $1000.

THE CLEVELAND MASTER PLUMBERS' ASSOCIATION held their regular bi weekly meeting last week in the Builders' Exchange, Cleveland, Ohio. After a discussion of trade matters the following officers were elected: D. H. Roberts, president; Eb. Allen, vice-president; S. W. Burrows, treasurer, and L. Bonesteel, secretary.

THE MASTER PLUMBERS' ASSOCIATION of St. Louis have elected officers for the current year as follows: President, John Mahon; first vice-president, W. H. Kuhns; second vice-president, William Schwehr; recording secretary, William F. McCormack; financial secretary, John P. Kelleher; treasurer, E. J. Lonergan; sergeant-at-arms, A. J. Gallagher.

THE IOWA STATE PLUMBERS' ASSOCIATION will hold its annual meeting in Burlington, beginning January 22 and continuing until the evening of the 24th. The local committee of arrangements consists of Henry Ewinger, Geo. Stewart and C. G. Bosch.

Connecticut's Proposed Plumbing Law.

Through the courtesy of the secretary of the Connecticut State Association of Master Plumbers, John S. Craig, 59 Farrington avenue, Hartford, Conn, we have received a copy of the proposed plumbing law that has been introduced in the Legislature. A committee has been appointed by the association to give such information and assistance as are necessary to aid in securing its enactment. The text of the proposed law is as follows:

AN ACT RELATIVE TO THE LICENSING OF PLUMBERS AND THE SUPERVISION OF THE BUSINESS OF PLUMBING.

Be It Enacted by the Senate and House of Representatives in General Assembly Convened.

SECTION 1.

No person, firm or corporation shall engage in or work at the business of plumbing, either as a master or employing plumber or as a journeyman plumber, unless such person, firm or corporation has received a license therefor in accordance with the provisions of this act.

The word "plumber," as used in this act, shall be deemed to mean a person who has learned the business of plumbing by working for at least three years either as an apprentice or under an agreement for instruction, and who has then worked for at least one year as a journeyman plumber. The word "journeyman," as used in this act, shall be deemed to mean one who personally does any work in plumbing, the mode of doing which is subject to inspection under any ordinance, by-law or rule passed under the authority of this act.

SECTION 2.

That within thirty days after the Examining Board, hereinafter provided for, shall have organized, every person engaged in, or working at the business of plumbing in this State, prior to the 1st day of June, 1895, and desiring to engage in or work at said business, in any city or town where licenses for plumbing are required, shall register his name and address at the office of the Board of Examiners, to whom applications for licenses are to be made, in such city or town, and state under oath when and how long he has been engaged in or has worked at said business, and whether as master or employing plumber or as journeyman plumber.

Said Board of Examiners, if satisfied that the person so registering was actually engaged in or working at said business prior to said date, shall so certify to the Boards of Health of their respective cities or towns. The Board of Health shall thereupon issue to him a license setting forth that he was eugaged in or working at the business, either as a master, or employing plumber or journeyman plumber, as the case may be, prior to the 1st day of June, 1895, and authorizing him to engage in or work at said business, either as a master, or employing plumber, or as a journeyman plumber.

In the case of a firm or corporatiou, the examination and licensing of any oue member of the firm or the manager of the corporation shall satisfy the requirements of this act.

SECTION 3.

There shall be in every city, and in every town of five thousand inhabitants or more, and in every town having a system of water supply or sewerage, a Board of Examiners of Plumbers, who shall serve without compensatiou, appointed by the Board of Health of said city or town, consisting of not less than three nor more than five members, one of whom shall be a member of the Board of Health, as said Board may designate; also of not less than one nor more than two master plumbers, and of not less than one nor more than two journeyman plumbers. All the members of said Board of Examiners shall be citizens and residents of the cities or towns in which they are appointed.

SECTION 4.

Said Board of Examiners shall, as soon as may be, after their appointment, meet and organize by the selection of a chairman, and shall designate the times and places for the examination of all applicants desiring to engage in or work at the business of plumbing, within their respective jurisdictions.

Said Board shall examine said applicants as to their practical knowledge of plumbing, house drainage and plumbing ventilation, and shall submit the applicant to some satisfactory form of practical test, and if satisfied of the competency of the applicant, shall so certify to the Board of Health in their respective cities or towns. The Board of Health shall thereupon issue a license to such applicant, authorizing him to engage in or work at the business of plumbing, either as a master or employing plumber, or as a journeyman plumber.

The fee for a license for a master or employing plumber shall be two dollars; for a journeymau plumber it shall be fifty cents.

Said license shall be valid and have force throughout the State, and shall be renewed annually upon payment of a fee of fifty cents

In case of removal beyond the jurisdiction of the Board of Examiners issuing the original license, it may be renewed by any Board having like authority.

SECTION 5.

The Board of Health of each city or town mentioned in section 3 of this act shall within three months from the passage of this act appoint one or more inspectors of plumbing, who shall be practical plumbers of at least five years' experience, either as a master or as a journeyman, during the years next preceding the date of appointment, and who shall hold office until removed by said Board of Health for cause, which must be shown. All such inspectors shall before appointment be subject to examination by the Examining Board.

The compensation for such inspectors shall be determined by the Board of Health appointing them, and shall be paid from the treasury of their respective cities or towns.

Said inspectors shall inspect all plumbing work for which permits are hereafter granted within their respective jurisdictions in process of construction, alteration or repair, and shall report to said Board of Health all violations of any law, ordinance, by-law, rule or regulation relating to plumbing work, and also perform such other appropriate duties as may be required.

The approval of any plumbing by any other inspectors thau those provided for under this act shall not be deemed a compliance with the provisions thereof.

SECTION 6.

No Inspector of Plumbing in any city or town shall inspect or approve any plumbing work done by himself, or any persou by whom he is employed, or who is employed by or with him; but in each city or town subject to the provisions of this act, the Board of Health shall appoint an additional Inspector of Plumbing, in the same manner, and subject to the same qualifications as the regular Inspector of Plumbing, whose duty it shall be to inspect, in the manner prescribed in this act, plumbing work done by the regular Inspector, or any persou by whom he is employed, or who is employed by or with him.

Said additional Inspector shall have authority to act in case of the absence or inability of the regular Inspector, and receive for his services such compensatiou as the regular Inspector would for a like duty. The provisions of this sectiou shall not apply to auy city or towu which has heretofore established, or may hereafter establish, an annual salary for the position of Inspector of Plumbiug, and in any such city or towu no Inspector of Plumbing shall engage in or work at the busiuess of plumbing.

SECTION 7.

In each city or town of 5,000 inhabitants or more in this State, aud every town hav-

ing a system of water supply or sewerage, shall by ordinance, or hy-law, within six months from the passage of this act, prescribe rules and regulations for the materials, construction, alteration, and inspection of all pipes, tanks, faucets, valves, and other fixtures, by and through which water or sewerage is used and carried; and provide that no such pipes, tanks, faucets, valves, or other fixtures shall be placed in any building in such city or town, except in accordance with plans which shall be approved hy the Board of Health of such city or town. Said Board of Health have control of the enforcement of the regulations regarding plumhing; and shall further provide that no plumhing work shall he done, except in the case of repairs of leaks, without a permit being first issued therefor upon such terms and conditions as such cities or towns shall prescribe. But nothing in this section shall prevent Boards of Health from making such rules and regulations in regard to plumhing and house drainage hitherto authorized hy law, which are not inconsistent with any ordinance or by-law made under the authority of this section by the respective cities or towns within which such Boards of Health have jurisdiction.

SECTION 8.

Any person violating any provision of this act, or any ordinance, hy-law, rule, or regulation made thereunder, shall be deemed guilty of misdemeanor, and be subject to a fine not exceeding fifty dollars for each and every violation thereof. and his license may be revoked by the Board of Health.

Any city or town mentioned in section 3 of this act refusing to comply with any of the provisions of this act shall forfeit the sum of fifty dollars, to the use of the State for every month during which such neglect may continue.

SECTION 9.

The provisions of this act shall apply to all persons who are now, or may be hereafter, learning the business of plumbing when they are sent out to do the work of a journeyman plumber.

Any person now holding an appointment as inspector of plumbing who shall be eligihle to appointment under the provisions of this act, or who at the time of appointment had learned and had worked at the business of plumbing five years as a journeyman, shall be deemed to have heen appointed under this act.

SECTION 10.

The said Board of Examiners shall annually, before the 1st day of June, make a full report in detail to their respective Boards of Health of their cities or towns of all their proceedings during the year under this act.

All acts and parts of acts inconsistent herewith are hereby repealed.

Secretary Murray's Report.

Following is the report of Alex. W. Murray, the retiring secretary, read before the Chicago Master Plumbers' Association on the 14th inst.:

The association is to be congratulated upon its prosperous condition, having a good balance to its credit, a lihrary containing many valuable hooks treating upon sanitary suhjects, and a complete list of catalogues of the merchandise used by the trade, which is heing constantly added to. This is an important feature in the many accommodations of the rooms you have so generously furnished for the comfort of the members.

It had been the constant thought of your officers what would he the best manner of creating an interest in the meetings. The president in his admirable report has suggested some addition. I would recommend that at least 75 minutes of each meeting should be devoted to discussions upon mechanical prohlems pertaining to the trade. Another suggestion is that you have a quarterly meeting to which members of the craft whom you would consider as desirable members be invited. At such meetings it might he well to have a supper, so as to partake more of the sociable feature than of the plumbing business. Another suggestion is that the Executive Committee make a list of those who are not members, and make an official call upon them. In my many years of experience in association life, I have found many to say, "Why have I not been invived to join the association?" It is my belief that the returns would pay for the extra expense.

In conclusion, let me say that I may have heen particular in calling attention to those who were not prompt in reporting the work of the association, hut I simply did my duty as I viewed it. I thank the members and officers for their kind forbearance and universal courtesy extended to me during my 26 months' incumhency of the office, and wish the association a prosperous year.

Master Plumbers and Knights of Tabasco.

Ex-President Jeremiah Sheehan has prepared for publication a letter from which we quote as follows:

In a recent issue of the trade press I noticed an article from the pen of President Mitchell on behalf of the Executive Committee of the National Association of Master Plumbers, deprecating the future attendance at conventions of a certain class of drummers for manufacturers of plumbing material, now better known as the Knights of Tabasco; also, a reply to same from "Old Pepper" Thomas F. Cushing.

Mr. Mitchell's Motives.

In my opinion Mr. Mitchell's suggestions are very pertinent. Those who attended the excursion to St. Clair Springs on the last day of the Detroit convention can testify that the conduct of some of the hilarious knights was a disgrace. I do not claim that they were all knights; it is to be regretted there were a few hilarious plumbers.

The evident intention of the article was to discourage the tendency recently manifest—Hurrah for the convention and a good time, even at the sacrifice of decency. It is a plea for more orderly conventions and gives information to manufacturers as to their so-called duty.

To Whom Addressed.

It is not directed to the body as a whole, but to the few who have given displeasure to the many. It is directed only to those who merit the reproof. If there is any one who feels that the shoe fits, let him wear it.

There are many very genial, gentlemanly and worthy representatives of manufacturers whose attendance at the conventions is an honor to the association and a credit to their employers. These gentlemen have, by their influence, speaking a good word here and there, added much to the strength and efficiency of the National Association, and I hope will so continue to do. I do not think any one of this class feels that Mr. Mitchell's remarks are in any way directed to or affect them.

To me it appears to be directed more particularly to manufacturers, explaining that it was not expected of them that they should send their agents to the conventions, as has been represented by some agents. The manufacturers seemed to be of this opinion, judging from the action of the Central Supply Association, convened at Cleveland, passing a resolution discountenancing such future action. . . .

Contributions from manufacturers and jobbers for the entertainment of delegates should be discouraged and condemned. We are a large prosperous organization and able to bear our own expenses, and if not let us stay at home until we are. The national treasury has of recent years voluntarily offered quite a sum to local associations where conventions have been held, to help defray expenses. If it is necessary let us double the amount and be independent, as one body of business men should be of another.

THE MASTER PLUMBERS of Scranton, Pa., organized a local association last week and elected the following officers: President, H. J. Gunster; vice-president, Thomas Mullen; secretary, John J. Gorman; treasurer, John J. Howley. James F. Traynor, president of the Master Plumbers' Association of Wilmington, Del., was largely instrumental in getting up the association. He and William Stephens were present at the organization meeting and explained fully the objects of the associations throughout the country.

J. F. JENNINGS & Co, plumbers, are now located at 312 West Main street, Kalamazoo, Mich.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

LEVI MCBRIDE, Patterson, N. J., is doing the plumbing and heating in the residences of J. Weiss and A. Hopper. He also has the contract for the plumbing, tinning and copper work for the Eastwood silk mill.

THE COMMISSIONERS of Douglas County, Minn., have awarded the contract for heating, ventilating and plumbing the new Court House to H. Kelly & Co., Minneapolis, Minn.

THE CONTRACT for the metal work and plumbing on the cold storage house of A. C. Hunt & Co., Springfield, Mass., has been let to E. C. Atwater & Co. of that city.

THE NEW CITY HALL at Lansing, Mich., will be heated on the blower system, and bids for the heating will be asked.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until February 14 for the work including roof covering, drainage, &c., for the United States Post Office, Court House and Custom House Building at New Berne, N. C. Drawings and specifications may be had from the Supervising Architect at Washington or from the Superintendent at New Berne.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until February 6 for the low pressure return circulation steam heating and ventilating apparatus for the United States Custom House and Post Office Building at St. Albans, Vt. Drawings and specifications may be had from the Supervising Architect at Washington, or from the Superintendent at St. Albans.

KEHN BROS. & MERTZ, 289 East Kinzie street, Chicago, have the contract for steam heating in the store and flat building of Henry Ricke, Centre and Larrabee streets.

M. J. CORBOY, 78 Dearborn street, Chicago, is to do the plumbing, gas fitting and sewerage in the store and office building of J. B. Legnard, River and Dock streets.

GEO. L. ROOD, 79 Lake street, Chicago, is to install a Royal hot water heater in the residence of Walter McDonald, Calumet avenue, near Fortieth street.

P. NACEY & Co, 339 Wabash avenue, Chicago, are completing the plumbing, gas fitting and sewerage in the residence of Gen. C. W. Drew, Calumet avenue and Forty-third street.

STEAM AND HOT WATER.

Programme of the American Society of Heating and Ventilating Engineers.

The following is the programme of the first annual meeting of the American Society of Heating and Ventilating Engineers, to be held at 12 West Thirty-first street, New York, commencing Tuesday, January 22, at ten o'clock a.m.:

PROGRAMME.

Meeting to be called to order at 10 o'clock, Tuesday, January 22, 1895, at the hall of the American Society of Mechanical Engineers, 12 West Thirty-first street, New York City.

Order of Business.

1. Roll Call.
2. Reading of Minutes of Previous Meeting.
3. President's Address.
4. Report of Secretary.
5. Report of Treasurer.
6. Report of Chairman of the Board of Managers.
7. Report of Chairman of the Council.
8. Appointment of Nominating Committee.
9. Report of Special Committees.
10. Reading of Papers.

Papers.

a. "Determining the Heating Power of Heating Systems," by Prof. J. H. Kinealy.—Discussion.
b. "Heating and Ventilation of School Buildings," by T. J. Waters.—Discussion.
c. "Testing of Steam Radiators," by Prof. R. C. Carpenter.—Discussion.
d. "A Short Talk on Hot Water Radiators," by J. J. Wilson.—Discussion.
e. "A Prison Heating and Ventilating Plant," by H. B. Prather.—Discussion.
f. "The Literature of Heating and Ventilating," by H. J. Barron.—Discussion.

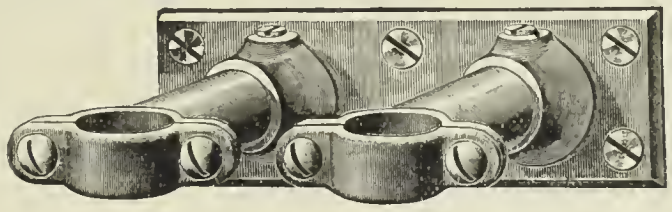
11. Election of Officers.
12. New Business.
13. Topical Discussion.

Topics for Discussion.

[These questions are allowable for discussion at any point in the programme believed desirable.]

1. In designing a system of heating and ventilation, shall we heat by radiation, and supply only tempered air for ventilation, or shall we heat by the air supplied for ventilation?
2. In a plenum system of heating and ventilation, which is the better for the air ducts, "off and on" hot and tempered air dampers, or "mixer" dampers?
3. The average amount of water condensed per 100 square feet heating surface per hour, in the different manners in which heating coils and radiators are erected.
4. The necessary size of risers for a given amount of heating surface, for the different sizes of pipes and coils, and for different classes and sizes of radiators.
5. The necessary size of horizontal mains for a given amount of heating surface, for the different size of pipes and coils, and for the different classes and sizes of radiators.
6. The probable future of electrical heating.
7. Necessity of automatic air and water valves on steam systems.
8. Where a propulsion fan is used for heating and ventilating a theater, is an exhaust or aspirating fan necessary?
9. What should we accept as the minimum standard of ventilation for various buildings, and what is the best means to employ to obtain this result?
10. Current systems of air delivery in simple indirect and fan system plants *vs.* plenum chamber system.
11. The consulting engineer and a common specification *vs.* "free for all" competition for contracts for heating and ventilating plants.
12. Value of standing committees of the society on test standards.
13. What is the proper proportion for cold air inlets to hot air furnaces?
14. Efficiency of extended surface in steam and water radiators.
15. The merits, if any, of vertical over horizontal circulation in hot water heaters.
16. Joints in sectional steam and hot water heaters, considering them as we find them in ordinary construction, such as gasket joints, screw joints, and push nipple joints.
17. The advantage possessed by metal over wooden cold air conduit.
18. Wrought iron pipe compared with steel pipe.
19. Compensation for plans and specifications.
20. Are mushroom registers under auditorium seats advisable or are all floor entrances for warm air objectionable?
21. In designing a hot water system shall we assume a cooling in the radiators of 15, 20, 25 or 30 degrees?

The council may change this programme as they think desirable during the progress of the evening.



Meetings will probably be held during the morning and afternoon of each day, and it is expected that the convention will last about three days. During the interim between sessions members will be invited to inspect the heating and ventilation of some of the more important plants in and around New York.

The location of the hall at which the meetings will be held is in the center of the hotel district.

This meeting promises to be a very important one, and it is hoped that the attendance will be large.

The Columbia Pipe Hanger.

We show in the accompanying illustration one form of the Columbia pipe hanger made by the J. W. Chamberlain Company, Bangor, Maine. The hanger is made single, double, triple and quadruple, and in all sizes, from ⅜ to 1½ inches, and finished as plain, galvanized, polished brass or nickel plated. The particular merit claimed for this form of hanger is that it does away with clamping the pipes close to the walls or ceilings, permitting the pipes to be hung from 1 to 4 inches from the wall, and can furthermore be taken down or adjusted to grade after the pipes are in place. It is pointed out that with the Columbia hanger pipes can be put up with a correct grade, regardless of the unevenness of ceilings.

Columbia Pipe Hanger.

The Heating of Greenhouses by Gas.

The following paper by William R. Chester was read before the Manchester District Institution of Gas Engineers in England:

Probably many of the members of this institution will, at some time or other, have had their attention turned to the possibility of heating small or moderate sized greenhouses with coal gas, and some of them will probably have carried out schemes for accomplishing this purpose. The great difficulty, however, in the way of a more extended application of the system is the cost of gas as fuel, which if burned continuously at even a small rate per hour throughout the day and night soon runs up the cost to considerable figures. In spite of this drawback, however, I am inclined to think that, when all things are properly taken into consideration, it will bear a favorable comparison with any other system of heating; and if an automatic arrangement be applied to the gas supply, to increase or diminish the consumption in exact accordance with atmospheric variations of temperature, it will be found that gas is both cheaper and better adapted than any other form of fuel for greenhouse purposes—at any rate, in all those cases where a moderate temperature only of (say) 50° to 60° is required.

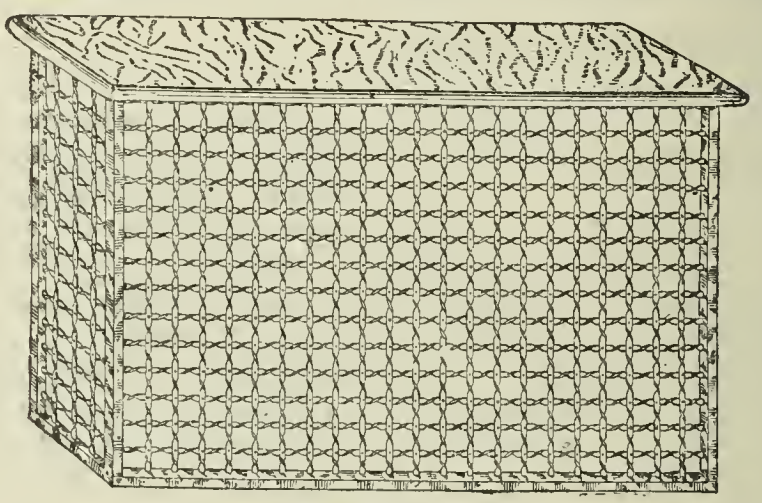
If we take a moderate sized conservatory of the lean-to type, 20 feet long, 12 feet wide, and 10 feet high at the top, sloping to 6 feet at the eaves, we shall

have a superficial area of glass amounting to about 440 square feet. Each square foot of glass surface is capable of cooling 1¼ cubic feet per minute of heated air in the interior of the conservatory to the temperature of the atmosphere outside; so that with a glass surface of 440 feet superficial, 550 cubic feet of air will be lowered to atmospheric temperature per minute. In order to maintain a constant temperature in the conservatory it will, therefore, be necessary to provide so much heat per minute as will raise the temperature of 550 cubic feet of air the number of degrees which is the difference between the interior and exterior temperatures of the air—say, about 30° F. The normal interior winter temperature required is about 50° F.; the exterior temperature seldom going lower than 20° F., or 12° of frost. Of course, the atmospheric temperature often gets lower than 12° of frost; but not in sheltered places, such as those in which conservatories are usually built.

Now 550 cubic feet of air represents about 45 pounds in weight; and the specific heat of air being 0.2375 as compared with water, we shall require to develop as much heat as will raise the temperature of 10.6 pounds of water 30° F. per minute, which is 318 B.T.U., or 19,080 units of heat per hour.

In a specially constructed boiler made to utilize, say, 80 per cent. of the total heat developed from the combustion of coal gas, we should be able to do this work with a consumption of 30 cubic feet of gas per hour, or 720 feet per day, which would cost, at 2 shillings 6 pence (62 cents) per 1000 cubic feet, (say) 1 shilling 9½ pence (44 cents). This consumption is based on the rather extreme supposition that the low temperature of 12° of frost would continue throughout the 24 hours; but as this is a rare occurrence, we may take it that the comparison is as unfavorable to gas as it is possible to make it. If during the daylight the atmospheric temperature should rise, the automatic regulator would come into operation and at once reduce the consumption of gas and proportionately diminish the cost. It would not, therefore, be unfair to take the cost of gas at 1 shilling 6 pence (37 cents) per day as an average. On the other hand, if a conservatory of similar size were heated by coal or coke burnt in an ordinary saddle boiler, such as is customarily used for the purpose, it would require from 1½ to 2 hundredweight per 24 hours, which, at (say) 8 pence (16 cents) per hundredweight delivered, would cost from 1 shilling to 1 shilling 4 pence (25 to 33 cents) per day. Add to this the wages of an attendant to fire up and clear away the ashes (say) two hours per day, at 5 pence (10 cents) per hour, the cost would be 1 shilling 10 pence to 2 shillings 2 pence (45 to 54 cents) per day. If the greenhouse be heated by hot air flues instead of by water pipes, the consumption of coal or coke would be still greater.

Extremes of temperature are always detrimental; and where solid fuel is used it is next to impossible to maintain that regularity in small greenhouses which is so essential. On this point alone the use of gas for heating purposes possesses an immense advantage. With solid fuel firing, the furnace is filled up at periods of the day or night, and as it burns through there is an excess of heat developed, which raises the temperature of the house too high. Then as the fire burns down, it is allowed to fall too low, and unfortunately sometimes, at critical periods, the fire has a way of burning out from want of attention, and thus producing perfectly disastrous results. With the gaseous fired boiler specially constructed for the purpose, this variation can never occur, and it may be depended on to maintain the temperature required with perfect regularity.



This specially constructed boiler, capable of maintaining the above high ideals, has yet to be made; for though I have experimented with many types, as at present manufactured, there are none which yet come up to the mark, and some of them fell very far short of it. The boiler must be constructed with a studded bottom and interior tubes with gills or studs on the inside for rapidly absorbing the heat and transmitting it to the water. It must be of such length as to absorb all the heat developed by the combustion of the gas except just the amount necessary to insure a continuous upward current; and it must be boxed in round the burner so as to admit no more air than is just sufficient for the complete combustion of the gas. At the top it must be provided with a cover and flue pipe, for carrying away the products of combustion. The flow and return openings must be not less than the water pipes to be heated—say, 3 inches in interior diameter; and the burner must be constructed to consume the maximum and minimum quantities of gas with perfect combustion. It must not fire back under any conditions; and when not required it must automatically shut off all the gas except the supply to a small pilot jet, which will at once reignite the gas at the burner when further heat is required. The consumption of gas must be controlled by the temperature of the conservatory, and automatically increased or diminished within fixed limits, which may easily be determined. When we have such a boiler—and there are no inherent difficulties in its construction — we shall, I am confident, have a wide field for the further development of coal gas for conservatory heating; and my principal object in writing this paper is to direct the attention of makers into this particular groove. It will be a profitable one both for them and for the gas producer.

Having outlined the possibilities which are to be attained in this direction, I will now give briefly the results obtained from an arrangement I have recently fitted up at Bestwood Lodge for the Duke of St. Albans. The conservatory is 41 feet 6 inches long, 26 feet wide, and 24 feet high from floor to apex of roof. The glass surface is 1965 square feet, and the cubical capacity is 19,162 cubic feet. The heating pipes are 3 inches in diameter; having a surface area of 431 square feet. The pipes were already in. The boiler is constructed of sheet copper, 15 inches in diameter and 2 feet high, with 1-inch vertical copper tubes, capped at the top, and fitted with a flue pipe for carrying off the products of combustion. The burner (atmospheric) is boxed in at the bottom, and perforations are made for the admission of the necessary quantity of air to insure complete combustion. The burner is of the ring type, with separate taps. The boiler is placed in a second conservatory, which it heats by radiation ; and the flow and return pipes have to pass outside a distance of 25 feet before they enter the large building, so that the conditions are entirely against obtaining favorable results. With a consumption of 60 cubic feet of gas per hour, the temperature of the large building was maintained at 66° with an outside temperature of 46°. The temperature of the flow and return pipes (which, by the way, are reduced to 1 inch diameter at the boiler) are as follows: Flow, 132° F.; return, 87° F. The effluent gases leaving the boiler were at 380° F., and their analyses (average of series of tests) were as follows:

	Per cent.
Carbonic acid	6.0
Oxygen	8.6
Nitrogen	85.4
Total	100.0

From these results the following defects are apparent: 1. The heating surface is deficient, the effluent gases being allowed to escape at too high a temperature. 2. Too large a proportion of air is permitted to enter with the gas. 3. The flow and return pipes at the boiler are much too small. 4. The radiating pipes are much too large for the boiler—*i. e.*, a much larger boiler is necessary for effective work.

I ought to mention that the whole application has been carried out as an experiment, with a view of determining the more correct proportions to adopt in the permanent installation, and to find out, on a practical working scale, how far it is possible to utilize coal gas for such a purpose with due regard to economy. On some future occasion I may have further information on the subject, which will probably be of a wider general interest to the gas industry.

Radiator Screen.

Radiator Screen.

An ornamental screen for use over radiators is being introduced by E. T. Barnum, Detroit, Mich., as shown herewith. The screens are generally made of twisted, quarter twisted or crimped brass, polished steel, bronze or copper, and of any size mesh and finish, or of other material if preferred. They are referred to as concealing the pipes or coils and as an improvement to the gen-

eral appearance of any room. The top may be of polished marble, as illustrated, or it may be of the same material as the sides, shaped oval, square or as desired.

HEATING NOTES.

Lockwood & Adams, 69 Centre street, will represent in New York this year the Holland Radiator & Mfg. Company. The new firm propose to make a push on their line of radiators, which is to have some new additions. D. A. Crowley will continue to travel in the interest of the Holland radiators from the New York house.

The Automatic Heating Company have been organized at Portland, Me., for the purpose of manufacturing machines and apparatus for the Ware Automatic Generator and Regulator. President, A. J. Hodder of Boston; treasurer, Leonard Shackford of Cambridge.

The steam heating establishment of Alger Leonard, Great Barrington, Mass., was visited by fire last week doing slight damage.

John A. Scollay, 74 Myrtle avenue, Brooklyn, N. Y., is issuing a new circular, printed in two colors, of his patent hot water thermometer. The different styles of thermometers are shown by illustrations. The features are a black fluid which can be readily seen at a distance and the ease with which the thermometer can be attached. A stationary cup is arranged to screw into a hole threaded for ¼-inch pipe. The thermometer is then set in the cup.

L. R. Blackmore, 88 John street, New York, on December 25, 1894, was granted a patent for a house heating boiler, to be used as a hot water apparatus or as a steam generator, for which it is said to have special advantages. It is of the vertical, sectional type, with provision for internal circulation and arranged to permit steam globules to rise to the steam chamber unhindered by the heating surfaces, so that, it is claimed, no difficulty will be experienced in maintaining a regular and steady water line. The feature of the boiler is the large surface exposed to the direct heat of the fire, which is accomplished by the arrangement and construction of the waterways. The boiler is provided with a device for heating air for admission to the combustion chamber to aid in consuming the gases and to prevent trouble from soot when soft coal is used. It is provided with a direct draft damper which, when closed, causes the products of combustion to make a downward turn and pass to the back of the boiler before escaping. The flues are so arranged that the draft affects all parts of the grate alike.

The Sperl Heater Company, Carbondale, Pa., have completed the equipment of their shop, and are now moving into it. The new plant consists of a machine and erecting shop and a boiler house, but there is ground enough upon which to build a foundry if it is deemed advisable to do so in the future. The boiler house is 32 feet long and 24 feet wide, and contains a horizontal return tubular boiler 48 inches in diameter and 14 feet long, rated at 50 horse-power. The machine and erecting shop is a two-story brick building 40 feet wide and 60 feet long, built on the plan of slow burning mill construction, fitted up with an overhead traveling crane covering its full length on one side. There is a tool and supply room in one corner downstairs and a temporary office upstairs. There are all needed toilet facilities and sanitary appliances. In the way of machine tools the shop is well equipped.

C. H. Barnes, who represents the American Boiler Company in Colorado, with headquarters at Denver, has been spending a few days at the Chicago office.

Lord & Burnham Company, manufacturers of greenhouses and greenhouse heating apparatus, have transferred their architectural department from Irvington, N. Y., and in future all preliminary plans, estimating and negotiating will be done from their office at 160 Fifth avenue, corner Twenty-first street, New York.

The John Davis Company, 69 79 Michigan street, Chicago, are doing the steam heating in the New Music Temple, Van Buren street, between Michigan and Wabash avenues.

Kroeschell Bros. Company, 41-59 Erie street, Chicago, are to install a steam heating plant in the Fort Dearborn 12-story office building, Clark and Monroe streets.

The following are the recent additions made to the selling force of the J. H. McLain Company, Canton, Ohio: E. A. Peacock at the Chicago office of the company, 88 Lake street; J. A. Farrell, who will travel from the Chicago office through Iowa, Illinois and Missouri. From the Canton office W. M. Klngsbury will travel in Northern Ohio, Northern Indiana and Michigan, and W. J. Blackmore will travel in Southern Ohio, Western Pennsylvania and West Virginia. J. B. Crowl, formerly with May & Fieberger of Akron will travel from the Canton office in Ohio and Michigan in the interests of their Oxford furnace only. J. H. Coleman, Jr., with headquarters at the New York office, will travel through the New England States, while George W. Plastow, heating engineer, formerly with Johnson & Morris of New York, will visit the city and suburban trade from the New York office.

The Specialty Mfg. Company of Waterbury, Conn., issue circulars calling attention to the Waterbury heat regulator, adapted for use in connection with hot air furnaces and steam and hot water apparatus. A number of testimonial letters, which occupy a large part of the circular, give an idea of the favor with which the device has been received at the hands of the trade.

Isaac A. Sheppard & Co.'s Exhibit.

Isaac A. Sheppard & Co., Philadelphia, have just completed an exhibit in the Builders' Exchange Permanent Exhibition in that city which is the largest to be found in the exhibition. It is situated in the northwest corner of the spacious exhibition hall, inclosed within a handsome gilt work screen, having an arched entrance, and occupies an area of about 300 square feet. A neat sign, surmounted by a model of a Paragon furnace, attracts attention upon entering. The center of the floor is devoted largely to the firm's well known Paragon steel drum furnaces. Six styles are shown, with and without casings, so that both interiors and exteriors may be readily seen and examined. Paragon furnaces are so constructed that the draft in their two combustion chambers is equal, thus making equal radiating surfaces. This equal distribution of heat is said to add to the endurance of the furnaces. The self cleaning arrangement of the drums and the large radiating surfaces are conspicuous in the interiors; and the small number of joints to be found is evidence of the gas and dust proof qualities possessed by the furnaces. The ball bearing frictionless grate is also an interesting feature. The later productions in the Paragon line will be supplied with either frictionless draw center or triplex grates, as may be desired. A No. 440 Paragon with cast radiator represents a line which the firm will shortly furnish in four sizes. A corner of the inclosure is occupied by a brick set paragon furnace with cast iron front. "Because a furnace is located in a cellar or basement is no reason why it should be ugly," was once remarked by a member of the firm; but the very handsome Renaissance design of front shown in this furnace would certainly make one wish that a better location could be accorded it. The upper panel of the front is removable, to allow of access to the drum. The front extends above the top of the radiator, so that the whole furnace may be withdrawn for repairs or other purpose without disturbing the brick work. The paragon line will shortly be augmented by the addition of a combined hot air and hot water heating furnace, to be made in three sizes. Other furnaces shown are the Saxon and Excelsior, as representatives of cheaper lines of effective furnaces; and the Fidelity, a first-class furnace, having a heating capacity somewhat less than the Paragon, and made in three sizes.

Arranged along the outer sides of the square are the ranges. A No. 88 Excelsior with double oven represents the firm's well known Excelsior line of ranges, of which there are nearly 100,000 in daily use in Philadelphia and vicinity. In these ranges the excellent flue construction is a leading feature. A Royal Fidelity No. 88 with horizontal boiler is shown as a specimen of another line of first-class ranges. A feature in this range is a cast iron shield of ornate design, used in connection with a cast iron mantel to cover the boiler and thus shield the operator from the boiler radiation. Another range of the same line is shown in connection with an ordinary upright boiler. Both ranges have hot air attachments for heating upper rooms. The Fidelity line of ranges is represented by two styles, a No. 80 with the regular horizontal boiler and a No. 7 without a boiler. The latter has a gas stove attachment to the plate warmer, designed for use in summer, instead of a separate gas stove. The attachment is especially applicable for use in flats and other places where economy in kitchen space is desirable. The Fidelity ranges have the same flue construction as the Excelsior.

A No. 6 Franklin fire place heater is shown as a ssmple of a line consisting of two sizes, with or without magazines, and with round or square fronts in nickel or Berlin black finishes.

While the exhibit does not cover the whole of the firm's products, it may be said to represent the lines most closely allied to the building trades.

New canning factories to the number of 102 were established in the Southern States last year, according to the *Tradesman*.

THE RETAIL STORE.

Poetry in Trade.

From a well known jobbing house in Tennessee we have the following communication, which explains itself:

As an illustration of the fact that it is no use for the Hardware dealer to try to "best" the school teacher in a war of words, we give a letter received to day from one of our customers, a teacher, who had bought a Gun of us some time since. We wrote him that, "owing to our impecuniosity we would like to have a litle reciprocity" in the shape of a check by return mail for the amount of his account. But he completely knocked us out with the following response:

With considerable curiosity,
And accelerating velocity,
I perused the gentle verbosity
Of your dun without animosity.

With sorrowful hesitation,
I make the declaration,
That my financial situation
Prevents a prompt liquidation.

With the humblest timidity
In the midst of sore turgidity,
I ask you to relinquish rigidity
And trust to my eager rapidity.

With candid and earnest and feeling sincerity,
I promise to use my utmost celerity.

Yours in adversity;
Not in perversity.

Steam Sterilizer.

The accompanying cuts represent a steam sterilizer offered by Silver & Co., 304-314 Hewes street, Brooklyn, with New York office 20 Warren street.

Fig. 1.—*Steamer.*

Into the bottles shown in Fig 2 is placed the proper quantity of milk, to which is added the proper quantity of barley, or oatmeal or gruel, or fresh water, to which is added sugar. The proportions to be used are indicated upon a food table accompanying the sterilizer. The bottles are then placed in the tray, Fig. 2, using the rubber bottle stoppers. The tray, with the bottles, is then placed in the steamer, together with water, the lid put on the steamer and the water allowed to boil vigorously over a fire for three quarters of an hour. The cup shown in Fig. 3 is provided with folding handles and a perforated false bottom,

Fig. 2.—*Tray and Bottles.*

and is for warming the sterilized milk for feeding. A funnel and bottle cleaner are furnished with the set, as in

Fig. 3.—*Milk Warming Cup.*

Fig. 4. The set, complete, is packed in a wooden case with a hinged cover, occupying a space 14 inches high and 9 inches square. The set includes a

Fig. 4.—*Funnel and Bottle Cleaner.*

steamer with quick boiling corrugated copper bottom, a bottle tray, seven graduated glass bottles, seven ventilated rubber corks with glass plugs, warming cup, funnel and bottle brush.

Gasoline Goods.

This is the season when the dealers of gasoline cooking apparatus are beginning to purchase, and the new goods are making their appearance. The enormous trade now done in this line is a satisfactory vindication of those who met with almost insurmountable obstacles in the introduction. Insurance is no longer a bugbear, as there are many companies broad enough to see that the element of danger, which was exaggerated for a purpose, has been almost eliminated by improved construction and familiarity that has come by using the fluid. The comfort and convenience have led to the use of gasoline cooking stoves all the year round in many households, some other means than the cooking apparatus being depended on in winter to supply heat. While what is known as the New Process stove has come rapidly into popularity and supplies a large part of the demand, the generating burner still has a large following in the colder sections of the country where evaporation is hindered by the low temperature in the winter season. The goods of to-day are far simpler than those first introduced and do not require as much attention or repairs. For cooking, where artificial gas cannot be secured from a gas plant, gasoline is destined to grow in favor and stay in the field. The only care needed is such as a careful housewife would give any apparatus. It must also be borne in mind that the fluid is very volatile, and a leak in the can or reservoir may lead to disastrous consequences if a flame is brought in contact with the gas. Dealers now thoroughly understand the necessity of care in this matter, and explain it to buyers, so that it is only through the utmost negligence that an accident can happen.

Dietz Crystal Lantern.

R. E. Dietz & Co., 60 Laight street, New York, have brought out the Dietz New Crystal Tubular Lantern, with

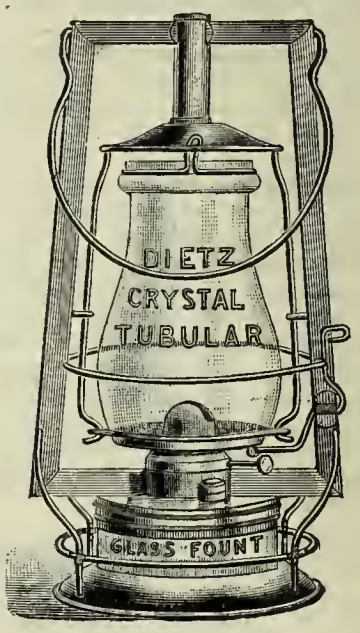


Fig. 1.—*Dietz Crystal Lantern.*

removable glass fount, as shown in the accompanying cuts. It is referred to as strongly made, and special attention is drawn to the transparent glass fount, which is adequately guarded. In case of an accident to the fount, a new one can be as easily substituted as a globe. Fig. 1 represents the lantern in normal condition. Fig. 2 shows the side wires supporting the bottom and holding the

fount in position, detached so that the fount can be removed or replaced. Fig. 3 indicates the method of raising the

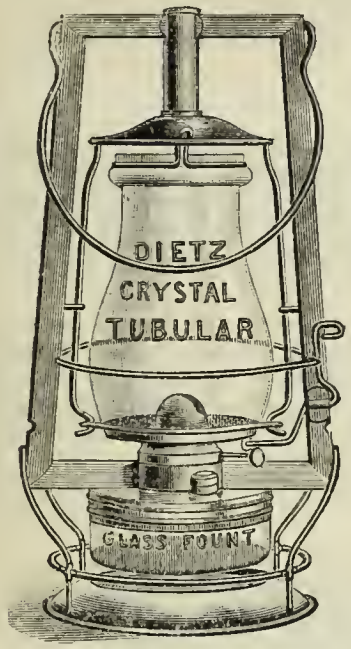

Fig. 2.—Bottom Wires Detached.

globe for the purpose of trimming or lighting the wick. The lantern is 14

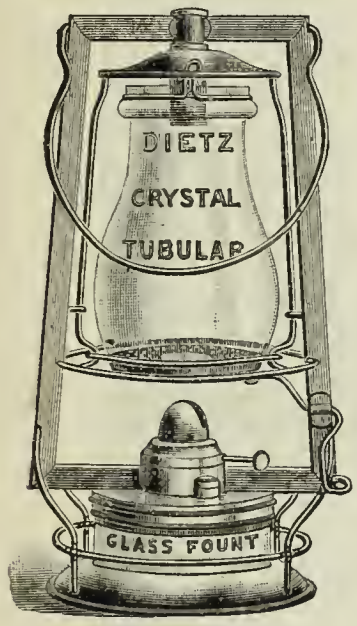

Fig. 3.—Side Lift for Raising Globe.

inches high, takes a No. 1 burner, $\frac{5}{8}$-inch wick and No. 0 globe.

MEMORANDA.

E. A. Blanchard of Springfield, Maine, and E. W. Bradeen of Old Town, Maine, have purchased the stove, tinware and plumbing business of Daniel Sawyer, and will take possession April 1. Mr. Blanchard has been in the same business in Springfield, and Mr. Bradeen has been connected with Mr. Sawyer's establishment.

W. A. Guenther & Sons, Owensboro, Ky., have adopted a rather unusual as well as a novel form of circular, calling the attention of retail customers to their stock of Hardware, Stoves, Mantels, Grates, &c. The circular is a strip of paper 2 inches wide and 2 yards long, rolled on a wooden spool. Different lines of goods are treated under numbered headings, of which there are 17. Attention is also called to a plan of guessing, by which a $60 steel range is given to the successful cash customer.

Showcase Refrigerators.

Among the refrigerators put on the market for the coming season by the Challenge Corn Planter Company, Grand Haven, Mich., for whom Barnard B. Neal, 106 Chambers street, New York, is agent, are the two shown in the accompanying cuts. The refrigerator shown in Fig. 1 is referred to as being neat in appearance and as filling the requirements of a refrigerator and a showcase in which there is a perfect circulation of cold air. It is particularly designed for the use of butchers, allowing the display of cut meats, fresh and juicy, in plain view of cutomers and yet protected from heat, dust and flies. The refrigerator shown in Fig. 2 has glass on three sides, while the panels around the ice chamber are of beveled plate mirrors. The ice door is on the back of the case. It is remarked that the case is made of kiln dried ash, filled and finished in antique with shellac and coach varnish, and that the case is provided with the company's new air tight lock. This refrigerator is designed for the use of restaurants, grocers or florists.

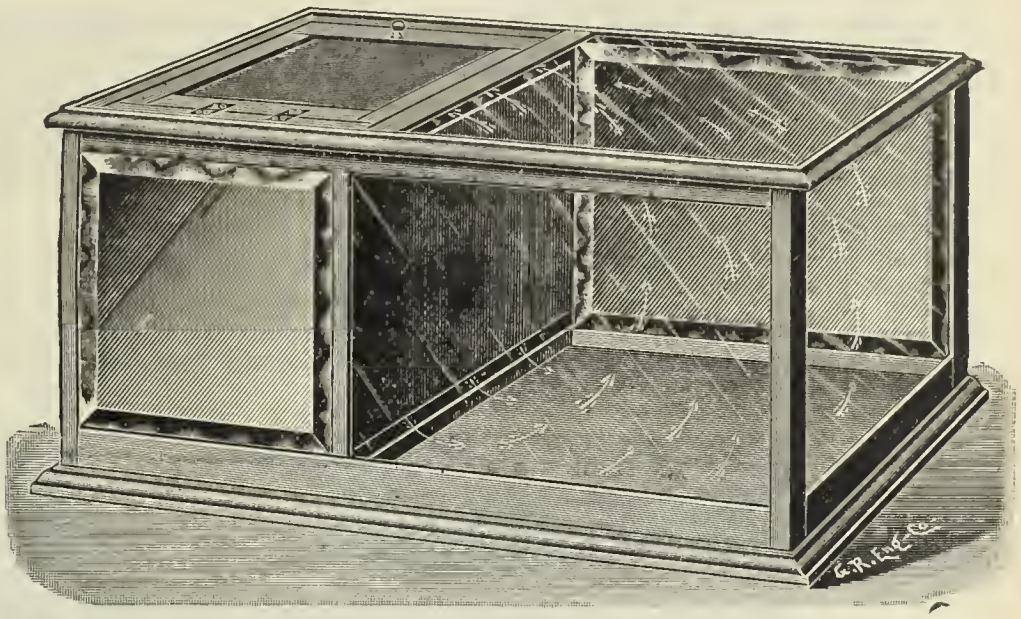

Fig. 1.—Showcase Refrigerator.

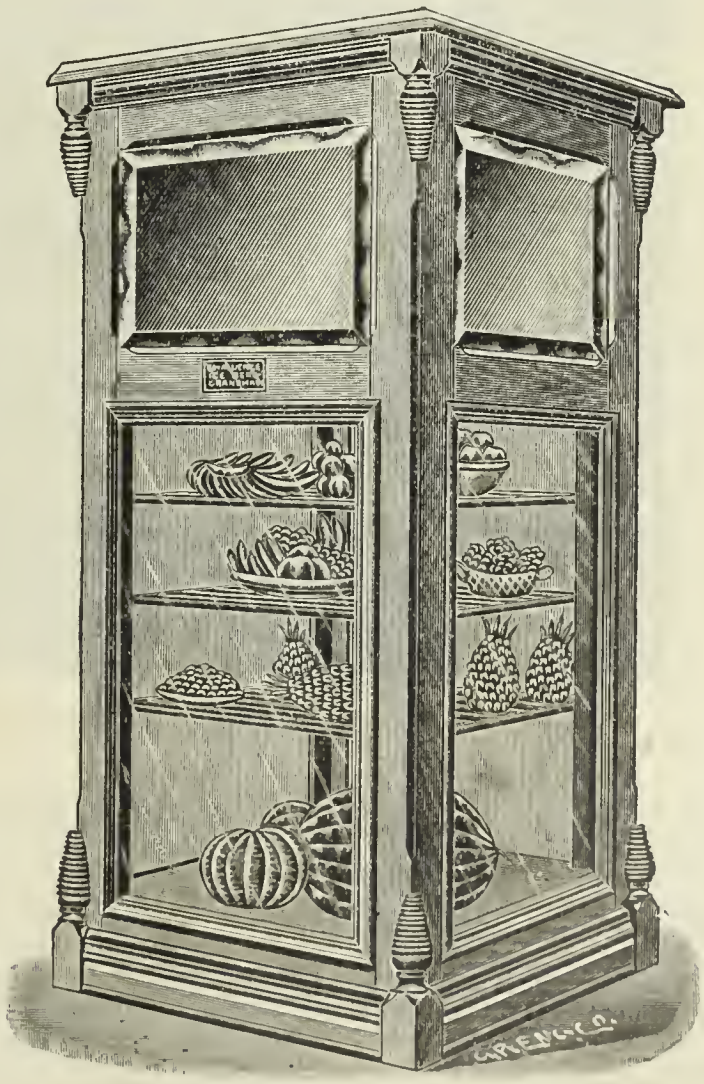

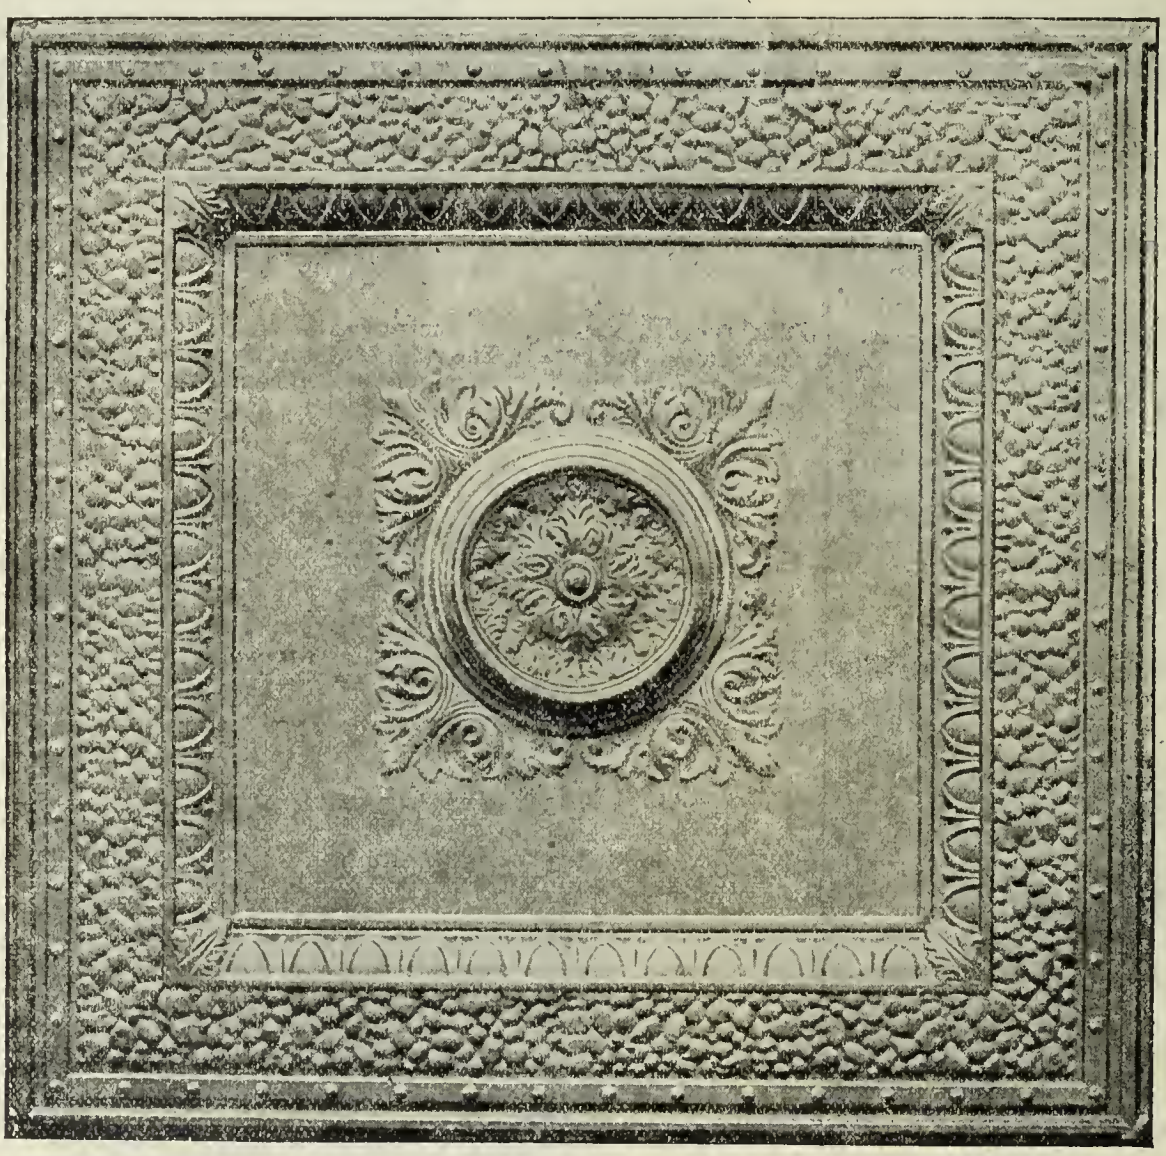

Fig. 2.—Refrigerator for Restaurants, Grocers, &c.

ROOFING AND CORNICE.

Ceiling Panel Plate with Enriched Center.

The accompanying illustration shows a piece of very handsome sheet metal work, the product of the Penn Iron Roofing & Corrugating Company, Limited, Philadelphia. The illustration is of the German Renaissance pattern of ceiling panel plate, and the design is accurately reproduced in the engraving, which brings out clearly its many attractive features. The plates cover 31¾ inches square of space after making the dovetail lock joint lap, which is dustproof and requires no extra work in puttying and closing. It also forms a separate finished center in itself when desired and when applied wholly as a ceiling in combination with the enriched coves, borders, moldings, &c., of the same manufacturers. The plate is made without the enriched center or with complete centers of any styles. The plates can be worked in combination with the art steel ceiling plates of this firm, and can be so arranged as to combine with beam or drop girder designs and rich corner blocks in the combination, when so desired. A great deal of time has been spent in the preparation of this new plate, which is stamped from a solid sheet of steel. The pressure needed to make its form will be understood when it is stated that it takes 34 inches square of flat material under a pressure of 650 tons, by several operations, to bring the plate up to its finished form with a 1¾ inch depth of molding. The firm, we understand, have been experimenting over five years in perfecting this operation.

Ceiling Panel Plate with Enriched Center.

FLASHINGS.

T. C. McDonald Roof Paint Company have opened an office at Savannah, Ga., and will manufacture there the McDonald roof coating paint and roofing cement, of which they are the sole proprietors.

E. C. Atwater & Co., Springfield, Mass., have been awarded the contract for the cornice, gutters and ventilators and also for the tin covering of the Highland Brewery, at Springfield.

The Cortright Metal Roofing Company, Philadelphia, with Chicago office at 134 Van Buren street, manufacture an extensive line of roofing materials, including metal slates, Victoria shingles and trimmings for ridges, hips, valleys, &c. These goods are made of tin plate, galvanized steel or copper, as may be desired, and are highly spoken of for their ornamental appearance as well as for their efficiency. The manufacturers advise us that the tin plates used are full weight and that they do not handle light plates or wasters. They also call attention to the reduced price of tin, which enables them to sell their product at low figures.

According to a recent issue of the Bethlehem *Times* the Slatington-Bangor Slate Syndicate of Slatington, Pa., enjoyed an exceedingly gratifying demand for their specialties during the year just brought to a close. It is stated that they sold and shipped more than 1300 cars of roofing slate, aggregating 57,000 squares, and more than 180,000 square feet of slate blackboards, this being nearly double the quantity sold in 1893. The syndicate made shipments from more than 40 different quarries during the year, sending the product into nearly every State and Territory, as well as Canada and Mexico. The success which the company have achieved is due in no small degree to the business enterprise and sagacity of Manager James L. Foote, who reports that the outlook for the present year is very flattering. He is of the opinion that the demand for slate will exceed that of any previous year and that better prices will prevail. It is stated that the company have already booked orders for spring shipment for

more than 7000 squares, and it is the expectation to market fully 100,000 squares of roofing slate before the end of the year. The leading brands are the "American Bangor," "Pennsylvania Queen," "Old Reliable Big Bed" and "Star Union."

BUYERS of eave troughs will be interested in the revised list printed in our Trade Report this week giving the prices adopted at the first regular meeting of the United States Eave Trough and Conductor Pipe Association, held at Cincinnati, January 9.

top of the large card used, while to the lower part are attached leaves for the several months as well as a full card calendar for the year. Casual attention is called to their Perfection steel roofing, Gilbertson's Old Method roofing tin, and general roofing and tinsmiths' supplies.

A Specimen of Fine Copper Work.

Schaeffer Bros. of Chicago have recently made and put in position the

A Specimen of Fine Copper Work.

EBERTS BROTHERS COMPANY, Limited, Detroit, Mich., favor us with a calendar for the current year. The decoration of the publication, which is a prominent feature of it, is a winter landscape, replete with snow and ice. The background and avsilable spaces are filled with references to the business of Messrs. Eberts, telling what they deal in and what work they do.

FRANK VOIGHTMANN, 129 131 Franklin street, Chicago, is doing the copper and galvanized iron work, slate and tile roofing on the Court House at Fort Worth, Texas.

THE ILLINOIS ROOFING AND SUPPLY COMPANY, 203 Lake street, Chicago, have issued a finely illustrated wall calendar. A spirited engravlng adorns the

copper cornice work, metallic roofing, bay windows, light courts and skylight work on the handsome and unique Viking Block, corner of North and Washtenaw avenues, Chicago. F. Knudsen is the architect and O. A. Knudsen the owner of the building, which is 132 x 51 feet, four stories high. A great deal of copper work was required for the ornamental cornice and for the bay windows. Two banks of bay windows project from the side. The design of the building being of a decidedly ornamental character, it was necessary that the copper work should correspond. The block is surmounted by four towers, giving the top an appropriate finish. These towers are also covered with copper. The main tower is on the corner of the building at the junction of the two avenues, and is built considerably higher than the others. At its apex, 109 feet above the street level, is placed a large model of the Viking ship of World's Fair renown, made of 14-ounce copper. An illustration of this ship is herewith given.

Charles Schaeffer, 928 North Tallman avenue, Chicago, who designed and constructed this handsome piece of work, has furnished us with the following details of its dimensions, &c.: The length of the hull is 4 feet; depth, 11 inches; width, 12 inches; hight, from keel to pennant, 5 feet. The globe shown underneath the ship is 15 inches in diameter. The ship revolves on glass bearings, which are placed part way up in the mast on the upper end of a 1¼-inch iron rod that extends down into the cupola. On these bearings the ship revolves, responding to the slightest change in the direction of even the lightest breeze. The hull is made so as to withstand the pressure of very heavy winds. It is strongly braced, and is extremely rigid in every particular. The ropes, which are made of wire, are ¼ inch thick. Owing to the fact that the ship has no deck, the bottom of the keel is perforated at intervals along its length with ⅛ inch holes to allow water to escape. The planks of the hull, the seams in the sail, and the figure at the prow with the finial at the stern are all skillfully reproduced in the beaten copper. The excellent character of the work has attracted much attention, as the elevated position of the ship enables it to be seen for a great distance in every direction, and the observers approach it to get a better view.

A movement is on foot in Philadelphia to secure for the School of Industrial Art of the Pennsylvania Museum the balance of the fund left to the city in trust by Benjamin Franklin for the benefit of poor artisans. Petitions are being circulated for this purpose, setting forth the claims of the school and its advantages to the artisans and textile workers of Philadelphia. It is argued that as the apprentice system is now defunct in the city there is no object to which the fund could be diverted which is more in line with the distinguished testator's intentions.

An electrical expert, quoted in a New York journal, puts out the following danger signal: "I have a word of advice to give people who carry steel rod umbrellas these wet days. They must keep a sharp lookout for arc lights while pushing their steel rods through the air. Of course this only applies when the current is on, and when it is, if the umbrella rod comes in contact with the lamp, there is a strong probability that the holder will be very badly shocked, if not seriously injured."

The annual summary of shipping arrivals in the port of New York during the past year, compiled at the Barge Office, shows that 4761 vessels arrived from foreign ports in that period. Of this number, 2984 were steamships. Englsnd heads the list with a total of 2383 vessels, the United States coming next with 1125. Germany and Norway take the third and fourth places. Vessels of other nationalities coming to this port were as follows: Holland, 152; France, 96; Italy, 92; Belgium, 77; Spain, 59; Denmark, 34; Portugal, 24; Sweden, 8; Russia, 6; Austria, 6; Hayti, 4; Hawaii, 3; Brszil, 2.

TIN PLATES.

The Tin Plate Wages Dispute.

On Monday, the 14th inst., a meeting was held in the Monongahela House, Pittsburgh, attended by a number of tin plate manufacturers and representatives of the Amalgamated Association. The firms represented in person at the meeting were New Castle Steel & Tin Plate Company, New Castle, Pa.; the Cumberland Steel & Tin Plate Company, Cumberland, Md.; Falcon Tin Plate & Sheet Company, Niles, Ohio, and Ætna-Standsrd Steel & Iron Company, Bridgeport, Ohio. The meeting was called at the suggestion of several tin plate manufacturers who were desirous, if possible, of ending the long struggle between the tin plate manufacturers and the workmen which was inaugurated some four months ago. The conference convened about 2 p.m. on Monday, and after long arguments from both sides, in support of their respective positions, the meeting adjourned without anything definite having been accomplished.

On Tuesday, however, another conference was held between representatives of the Cumberland Steel & Tin Plate Company and officials of the Amalgamated Association, and a settlement was reached. It will be remembered that the original demands of the tin plate manufacturers were for a reduction of 30 per cent. in rollers' wages and 25 per cent. for doubling and heating. At the above conferences the Amalgamated Association agreed to allow a reduction of 15 per cent. in wages for rollers, and 12½ per cent. in wages of doublers and heaters. Under the old scale wages were based on gauges 29 and 30, rollers being paid $5.30 per ton of 2240 pounds, doublers $2.70, heaters $2.48 and shearmen $1.76. Under the new scale rollers will be paid $4.50 per ton, doublers $2.36, heaters $2.17 and shearmen $1.54.

For heavier gauges than 29 and 30 the reduction is smaller. On Nos. 27 and 28 rollers will be paid 12½ per cent. instead of 15 per cent., and doublers, heaters and shearmen 10 per cent., instead of 12½ per cent.

At the conclusion of the conference the Cumberland Steel & Tin Plate Company signed the Amalgamated Association scale, and later the New Castle Steel & Tin Plate Company, New Castle, Pa., also signed. These concerns who operated their plants right along under the old Amalgamated Association scale will immediately be allowed the concessions just granted by the Amalgamated Association. As to what effect this will have on those plants that are now idle cannot be stated. It is the impression, however, that additional concerns will sign the scale within a short time. The above conferences were held independent of the Tinned Plate Manufacturers' Association, and the presumption is that the firms who have signed the compromise scale will no longer be members of the above organization.

British Tin Plates in 1894.

Griffith's Annual Review of the iron, steel and allied industries in Great Britain for the year 1894 summarizes the condition of the Welsh tin plate industry as follows:

Most of the works in South Wales and Monmouthshire have been halting between stopping and starting throughout the year. Common coke plates were in January sold at 10 shillings 6 pence a box in Liverpool, and penny by penny the price has gradually been pushed down to 9 shillings 6 pence. In October the American tariff was reduced to $1\frac{2}{10}$ cents per pound, and this was accompanied by an immediate increase in shipments to the States, but though the returns for the months since the duty was reduced are much above the average for the year, they are not what was looked for after such long-continued short shipments. In our opinion, as yet, the American manufacturers of tin plates do not know either the weakness or the strength of their position under the Wilson tariff, and equally, we think, the Welsh manufacturers do not know their own hand. The collapse of business in the States in the earlier months of the year threw everything out of gear. On one hand it favored 'domestic' manufacturers by reducing costs; on the other, for a time, it paralyzed the power of the nation to digest (or consume) its own or any other people's manufactures. After the new tariff took effect, the whole of the American works were laid off by labor troubles; now they have resumed with non-union labor; and we shall soon be able to judge where the balance of power lies—*i. e.*, whether or not the $1\frac{2}{10}$ cents per pound duty is sufficient to turn the scale in favor of America. It has always been our opinion that cheap labor was not sufficiently plentiful in the States to enable tin plates to be made there so economically as in South Wales, and therefore we hold, on economic grounds, that South Wales, and not America, is the place to make these things. If the whole process can be carried out mechanically with satisfactory results, then, duty or no duty, South Wales would at once lose her hold on the American market. The course of events in the tin plate trade this year will be watched on both sides of the Atlantic with peculiar interest.

SCRAP.

Two existing tin plate manufacturing companies are said to be contemplating the removal of their plants to Burgettstown, Washington County, Pa.

THE COMPLETED RETURNS of shipments of tin and terne plates from Great Britain to the United States during the past year show a total of 226,879 tons, against 255,583 tons in 1893, 276,479 tons in 1892 and 325,145 tons in 1891.

MARSHALL BROTHERS & Co., Philadelphia, Pa., send out a very tasteful calendar for the current year. It is a large sheet carrying the usual tablet of monthly calendars. The upper part presents the firm's name and calls attention to American tin and terne plates, besides giving the location of their offices and mills. Besides tin plates this firm make pickled and cold rolled sheets for tinning, lead coated sheets and corrugated sheets.

THE REYNOLDS BROTHERS CAN MFG. COMPANY, Havre de Grace, Md., have been incorporated to manufacture tin plate. The directors are Wesley M. Reynolds, William Vincent and others, and the capital $25,000.

THE ANDERSON FOUNDRY & MACHINE WORKS, Anderson, Ind., are reported as full of orders. They are now working on contracts for tinning machinery for the following concerns: Grest Western Tin Plste Company, Joliet, Ill.; Monongahela Tin Plste Works, Pittsburgh, Pa.; Ellwood Tin Plste Works, Ellwood City, Pa.; Cincinnsti Corrugating Company, Piqua, Ohio; Irondale Steel & Iron Company, Middletown, Ind., and the National Tin Plate Works, Anderson, Ind.

IMPORTS OF TIN PLATES into the United States during the 11 months ended November 30, 1894, according to the returns of the Bureau of Statistics, were of the value of $10,896,819, as compared with $14,764,333 in the corresponding months of the previous year.

B. F. BUTLER, JR., Mason Building, 70 Kilby street, Boston, who has been for some time the Boston agent of the Pottstown Iron Company, has also been appointed New England representative of the Phillips Tin Plate Company of Philadelphia. This company's product is high grade bright tin and terne plates.

THE LLANGENNECH TIN PLATE WORKS, Llangennech, Carmarthenshire, and the Melyn Works, Neath, Glamorganshire, South Wales, are reported as having restarted this week.

THE TIN PLATE WORKERS formerly in the employ of the United States Iron & Tin Plate Mfg. Company, Demmler, Pa., and who propose to put up a co-operative tin plate plant at a cost of $40,000, have been offered two free sites. One is in Port Vue, opposite McKeesport, Pa., and the other in Versailles borough. A Board of Trade committee will look into the project and decide upon the suggestion to offer a bonus of $10,000 to the new concern to

locate in McKeesport. It is stated that subscriptions aggregating about $25,000 have been received from the workmen.

THE WELL KNOWN New York tin plate and metal importing house of Robert Crooks & Co. have established themselves in their new quarters at 138 Front street, where the firm occupy the whole of the first floor. They are now in possession of a suite of commodious offices, handsomely appointed and affording much greater facilities than were found in their former location.

A FEW OF THE TINNING POTS in the new plant of the Monongahela Tin Plate Company, at Pittsburgh, have been put in operation, and it is expected that some of the black plate mills will be started up before this month is out. So far the concern have been buying black plates in the open market.

THE NEW CASTLE STEEL & TIN PLATE COMPANY, New Castle, Pa., contemplate making some extensive additions to their plant, the nature of which has not as yet been fully determined.

"TIN COATS" is the title of a neatly gotten up little 8 page pamphlet distributed by Henry W. Scattergood, Black Diamond Tin Plate Works, Philadelphia, containing information and advice regarding roofing tin in general and Scattergood's Black Diamond plates in particular. The text is diversified with cleverly drawn cuts of colored folks, each picture having worked into it the trade-mark of the concern—a black diamond.

THE PENNSYLVANIA TIN PLATE COMPANY of New Kensington, Westmoreland County, Pa., were chartered at Harrisburg this week with a capital of $200,000. This is the company who will operate the large tin plate plant now being erected at New Kensington by the firm of Goldsmith & Loewenburg.

Trade Notes.

THE JOSEPH DIXON CRUCIBLE COMPANY, Jersey City, New Jersey, are distributing a third edition, revised for 1895, of their pamphlet, entitled, "Graphite as a Lubricant Scientifically and Practically Considered; Also Its Value as an Accessory for Engineers and Machinists." The pamphlet is an interesting publication for those who desire to learn about the advantages of graphite for the purposes mentioned.

THE GRISWOLD MFG. COMPANY, Erie, Pa., on December 17, 1894, commenced suit in the United States Circuit Court at Minneapolis, Minn., against William Donaldson & Co. of that city for infringing their patent No. 229,250 on the the American Waffle Iron, the charge being that they were continuing to handle a waffle iron which the Supreme Court had declared was a direct infringement of the above-mentioned patent. The Griswold Mfg. Company were immediately granted a preliminary injunction against them from handling this waffle iron in any way, and on the 9th of January this injunction was continued against Donaldson & Co. from any further infringement of such letters patent on the American Waffle Iron, which patent the United States Court of Appeals has fully sustained. The Griswold Mfg. Company advise us that while they do not intend to bring suits against their friends in the trade, they are desirous of protecting their rights against those who willfully insist on disregarding their rights in this matter.

A FULL PAGE ADVERTISEMENT in this issue contains the interesting announcement of the F. H. Lawson Company, Cincinnati, Ohio. This firm are manufacturers of Tinware, Japanned Ware, Ironware and various specialties, including Street Lamps, Galvanized Oil Tanks and Cans, Water Coolers, Coal Vases, &c. They also are importers of and dealers in Tin Plate, Copper, Brass, Sheet Iron, Tinners' Tools, Tinners' Supplies, &c. A feature of the announcement is the reference to Lawson's Old Process Guaranteed Roofing Plate. This firm were established in 1816 and some illustrations show the various warehouses they have occupied.

THEIR MANY CUSTOMERS will regret to learn that the offices and warehouses of Ledwidge & Co., dealers in tinners' supplies, at 234 Lake street, Chicago, were closed by the sheriff on the 11th inst., on heavy confessions of judgment. The firm, which was composed of Matthew Ledwidge as sole manager, had one of the largest jobbing businesses in that line in the city, but it is estimated that the assets will not exceed $20,000, while the confessions entered pass that amount by several thousands of dollars. They were as follows: C. H. B. Sheet Milling Company, $5023; Clark, Quien & Morse, Peoria, $3500; C. S. French & Co., New York, $5023; Falcon Iron & Nail Company, Niles, Ohio, $6500; Revere Copper Company, Boston, $1500. There is another confession in favor of an uncle of the defendant, a London capitalist, for $2500. The sheriff took possession of the Lake street offices first, and, not finding sufficient property to satisfy the judgment, levied on the warehouse under the West Randolph street viaduct. It was filled with sheet steel and iron and tin plates. It is said that Mr. Ledwidge attempted to carry on a large business with a small capital and overtaxed his credit. All the confessions entered were, with one exception, on notes given for stock bought on credit. The firm were supposed to do a business amounting to $200,000 annually. Mr. Ledwidge established the business six years ago.

NATIONAL WRINGER & MFG. COMPANY, Canton, Ohio, are very busy, running 100 men ten hours a day and four hours at night. During 1895 they expect to do the largest year's business in their history, and are now making arrangements for the erection of an additional factory.

KEUFFEL & ESSER COMPANY, New York, issue an 1895 illustrated catalogue of over 400 pages, which is not merely a reprint from former ones, but has been rewritten, revised and enlarged by more than 100 pages. While the company confine themselves strictly to their line of business—Drawing Materials and Surveying Instruments—they have endeavored to omit nothing in this line which is good and reliable, and the catalogue therefore represents, it is remarked, the latest real improvements and the progress made since their last edition. There is also a large amount of explanatory matter, such as a short treatise on Drawing Paper, explanations about Drawing Instruments, of Planimeters and similar instruments, a description of the progress of Surveying Instruments, an illustrated paper on Verniers and their application, &c. Distributed through the book are a number of views of the several departments of the company's store and factories.

WILLIAM M. GOBEILLE, Main and Center streets, Cleveland, Ohio, is sending circulars to the trade directing attention to his facilities for making patterns. An announcement which is printed on a postal card is a clever bit of rhyming, printed, however, as ordinary prose.

THE WOODSTOCK OIL CAN COMPANY, Woodstock, Va., have been organized with J. C. Baker, president; I. R. Irwin, secretary; George W. Koontz, treasurer, for the purpose of manufacturing an improved oil can.

WALLACE & SONS, Brass & Copper Rolling Mills, New York, issue a notice that their new catalogue for 1895 will soon be ready for distribution, which will contain the latest revised price-list of goods of their manufacture that are in force at the time.

THE HEATING TRADE will be interested in the announcement of the American Boiler Company, 84 Lake street, Chicago, and 94 Centre street, New York, which appears among our advertisements this week. Reference is made to their extensive line of Steam and Hot Water Heating Apparatus and the trade are asked to write for catalogue and prices.

THE GRISWOLD MFG. COMPANY, Erie, Pa., have just issued a supplementary catalogue of new goods which also directs attention to some of their old leaders. The first articles mentioned are the Erie hollow ware, then the Erie aluminum cast ware. Illustrations are shown of aluminum tea kettles and saucepans and skillets, also lemon squeezers. The next few pages are devoted to the new improved American waffle iron, which is illustrated and described; then the American wafer iron. This is followed by the new improved French waffle iron and the French waffle iron and gas stove; likewise the French waffle stove and the French griddle. Other goods mentioned are the Erie double broiler, the Erie coffee mill, the Erie sliding ice pick, gas blast forge, &c. An interesting article on the superior quality of cast aluminum cooking utensils completes the little pamphlet.

SCHOLZ & WIMMER will in the near future open up with a full line of stoves, house furnishing goods and hardware at 596 Rhomberg avenue, Dubuque, Iowa.

Real estate transactions in New York City since January 1 have been unusually large and indicate a promising amount of business in this field in the new year. Some exceptionally large deals have been consummated. Business property is reported to be in particularly active demand and the amount of this class of investment now on the market falls considerably short of requirements. Flat and tenement houses, dwelling houses and vacant lots are all sought after, notwithstanding the fact that a large number of dwellings stood vacant in the past year.

A contract has been placed for lighting the cars on the Brooklyn Bridge by electricity. The lights will be furnished by the trolley system, each car having 16 lamps of 10 candle power.

According to the computation of the Actuary of the Treasury at Washington, the population of the United States will reach 70,000,000 by the end of the present year.

STOVE TRADE NOTES.

The Local Stove Trade.

Nearly every man, be he ever so charitable, takes a sort of grim satisfaction on learning that adverse conditions affecting the welfare of his own business prevail generally and that others are affected by them as well as he. This satisfaction, poor as it is, and due to the weakness of human nature, is about all that many stove men reaped from their business during the past year. There is no denying, however, that it does tend to elevate the spirits which become depressed in times of poor business, to know that one is no worse off than his neighbors, as it allays uncertainty and accounts for the failure of well considered plans that were confidently relied upon to hold up one's business to, or force it beyond, a certain point, and that his methods were not at fault.

If any man so devoted himself to his own business during the past year to maintain its standard that he found no time to take observations of his neighbors' or to ascertain how it had gone with his competitors generally, it must have been a consolation to him to learn that he probably reaped as much return proportionately to his efforts as any of his competitors.

The year of 1894 made so poor a record for itself that it should not be hard in the new year to eclipse it, and it is encouraging to record that it starts off well. The greatest percentage of decline during 1894 occurred in January, when the stove business fell off anywhere from 40 to 75 per cent., this excessive decline being due to two causes. The main one was the unexpected and unusual sales of heating stoves made in January, 1893, owing to the extremely cold weather which January '94 did not have, and the general indisposition to buying anything until the people had taken their bearings on the opening of the new year to see what harm had been done during the great financial storm of the year before.

Manufacturers were at sea as to buying material or making goods. In fact they did not need to manufacture, many having run their foundries as long as the holidays for the benefit of their employees, thus giving plenty of stock on hand. The consequence was that foundries were closed indefinitely, and they deferred making contracts as the market at that time was a falling one, the poorest sort to stimulate buying. Jobbers were slow in seeking the manufacturer for the same reason of having carried over a large stock, and they had no anxiety about getting goods when wanted; dealers would not order a single stove they could do without, and urge the sale of anything in stock rather than buy another pattern called for; while the consumer would not buy a stove if he could escape death by freezing without buying one, so that it was as though the stove business from top to bottom had stopped breathing until conditions had been analyzed, bruises examined and losses ascertained, and again until it was learned, if possible, how the tariff cat would jump, or a business man found whether his business really belonged to him or his creditors, and whether it would be more appropriate to make an order or make an assignment.

The stove trade is certainly in a better condition now than it was then. Sales have increased about 20 per cent., and it cannot be attributed to the weather, for though we had some cold days in the first part of the month, it has been warm, rainy and miserable ever since, with a great deal of sickness from colds and grippe, conditions really hurtful to business. So far as the wholesale trade is concerned, the demand has been more general and not increased by larger sales of heating stoves, but by small increases in nearly every variety and every department, including the exporting of stoves. Remittances in settlement of last year's accounts are quite satisfactory in number and amount. Rather more paper is tendered than two years ago, but rather more money than a year ago. It is not well to shout until out of the woods, but to say less for January so far than is here said would be to deprive it of credit that is due.

California Stoves.

Our experience with Californians has always been of the most pleasant character. We have the highest regard for the citizens of the Golden State, and have often been inclined to envy the lot of those to whom Fate has been so kind as to give them the opportunity of residing in a locality whose climate is so universally praised. But there are cynics in the land, and they not only find fault with the climate of California but also speak disrespectfully of California stoves. Following is what one of these dyspeptics had to say in a recent issue of the Chicago *Record:*

This question of window screens in the South is as vexatious as is the stove question in California. Instead of advertising herself as what she is, a superb summer resort, California chooses to be known as a winter resort for invalids. The result is that people in delicate health flock to California in winter and, after shivering for two months, come away with a violent prejudice against California climate. In the sunshine California is lovely; in the shade California is as miserable a spot as ever drove an anæmiac to suicide. The plain truth is that the average temperature (from December 1 to March 1) in California is 60° outdoors; indoors it is 50°—that is to say, it is colder indoors than out.

Col. Mulberry Sellers (he must have been a native of California) used to say that all a person needed in order to keep warm was the appearance of heat. This is evidently one of California's pet theories. There are to be met with in that part of our country some of the most remarkable stoves we ever clapped eyes on. It is commonly reported that California has the biggest liars and the smallest matches in the world; we wonder that the stoves of California are not included in this *bon mot*, for surely it were hard to conceive of stoves more liliputian than these miniature affairs which are called into service whenever the chilled traveler lifts up his voice in expostulation against the alleged geniality of "our glorious climate."

Our friend Leigh Lynch had an interesting experience at Riverside. He arrived late in the evening and ordered a fire in his room, for the night was rainy, damp and cold. After supper he went to his room and sat down to read the newspapers. He felt so chilly that he rang the bell for the porter.

"I must have a fire," said Mr. Lynch, peremptorily. "I ordered one an hour ago, and it is very curious that my order was not attended to. I can't freeze to death; haven't you a stove about the place?"

"Of course we have, sir," said the porter, very much embarrassed; "I built your fire as you ordered, and—and—and you're sittin' on the stove, sir!"

Mr. Lynch arose and scrutinized the object upon which he had been sitting.

"Is that a stove?" he asked, disdainfully.

"Yes, sir," answered the porter, apologetically.

"Bless my soul! so it is," said Mr. Lynch. "I thought it was a new-fashioned kind of campstool!"

An expert scientist who was one of our party in California made a careful analysis of a dozen stoves, representing every size in use in what is termed the perennial (or banana) belt.

He reported (under oath) that the average California stove had a heating capacity of 3.32 of one candle power.

One of the ladies in the party carried off one of these stoves (as we recollect it was the Mammoth No. 1), and wore it as a charm on her watch chain.

Grinberg Brothers, 155 South street, New York, issue a circular of Eagle gas heaters and gas radiators. They are also preparing for the summer trade some new gas cook stoves. In addition to their gas stove business they manufacture a large line of sheet metal goods in stove pipe, adjustable elbows, &c.

ODD PLATES.

FRANK P. MCCONNA, the well-known representative of the Michigan Stove Company at Buffalo, will continue to visit the trade in New York and Pennsylvania in the interests of Garland stoves and ranges.

GEORGE G. GARRY of Indlanapolis, Ind., has accepted a position with the Michigan Stove Company of Detroit, and will represent them in the State of Indiana.

THE FOREMAN of the Buckeye Stove Company has recently been in Mancelona, Mich., dismantling the factory at that place, with a view to removing the machinery from there to the new works at Gladstone, Minn.

DE HAVEN & Co., Limited, of Pittsburgh, Pa., have issued an illustrated sheet printed in colors and folded to a size suitable for an envelope. On the sheet in script letters are the words, to which a hand points, "We ask a question." Unfolding the sheet we find the question to be "Do you handle a range for burning natural gas?" If the question can be answered in the affirmative the company suggest that before placing orders the merits of the Cindrella gas range be examined. They state that the Cinderella will contain some new features for this year, and that its excellence of construction and beauty of design are of a high order. The Cinderella will be ready for the trade about the first of February, and to those who are interested the company will be glad to send descriptive circulars and price-lists.

THE FOLLOWING DIRECTORS have been elected by the Canton Furnace Company of Utica, N. Y.: E. A. Carton, W. J. Carton, J. B. Jones and S. A. Batty.

JOHN T. HYATT, who has been for years the foreman of the mounting department of the stove works of Rathbone, Sard & Co., at Albany, has resigned to accept a responsible position at Troy, N. Y.

MCLANE & SCHANCK, Linesville, Pa., favor us with a very neat calendar for the new year. The card, which has serrated edges, measures 6 x 8 inches, and has an eye for hanging it upon the wall. The upper portion is embellished with a picture representing the old way of making maple sugar, while another picture represents the new way. The latter involves the use of one of the firm's maple evaporators and other kindred appliances. The 12 leaves forming the calendar proper are attached to the lower portion of the card, the printing being in black upon a white ground. Accompanying the calendar is a circular illustrating and describing the evaporators made by the firm.

A. H. DAVE, who for the past three years had represented the Michigan Stove Company in Indiana, has been transferred to the Southern Michigan territory, where he formerly traveled for many years, and where he has a host of friends.

THE large force of employees of Rathbone, Sard & Co. of Albany have been made happy by a resumption of operations, after a shut-down of the plant for two weeks.

THE DANVILLE STOVE COMPANY of Danville, Pa., and 284-286 Pearl street, New York City, have issued an announcement in the shape of a neat folder relative to the spring season of 1895. Attention is called to the fact that the company will offer the trade new lines of gas stoves, four-hole ranges, furnaces, brick set ranges and the Beaver range, made from artistic patterns and executed by skilled workmen. In the line of Monarch gas and gasoline stoves they will offer the New Process, new high and low juniors, with single generating burner; their No. 14 stove improved for 1895 with continuous fire sub-flame; a new line of ovens, and numerous other special features.

WILLIAM G. BARROWS, 109 Fage avenue, Syracuse, N. Y., has just issued a book that will be of much interest to the heating trade. It is a collection of estimate blanks for warm air heating and was compiled with a view to making the blanks meet the requirements of furnace work. In the book, which measures 10 x 4½ inches, are 50 blanks, each one covering two pages. At the top of the first page are lines for the name and address of the customer; then come memoranda for the number of registers, partition pipes, total cubic feet to be heated, hight of the different stories. Following this in a wide column are lines for entering the price of the registers and borders, 12 spaces being allowed to them. Opposite the different sizes of registers are given the prices. Following is a list for pipe, register boxes, and heads covering 21 lines with prices opposite the goods. The second page continues with register boxes, elbows, boots, collars, dampers, thimbles, &c., and ends with miscellaneous items of labor, setting, board bills, railroad fares, mason work, &c. A double column is provided for the insertion of prices and at the end are lines for the total contract price and the date payable. A book of this sort for reference would be of great service to furnacemen and others.

CHAS. A. STOCKSTROM, president of the Quick Meal Stove Company and Ringen Stove Company, St. Louis, Mo., is off on a month's sojourn in Old Mexico. Mr. Stockstrom is making a distinct pleasure trip and is not associating business with his journey at all. He is making the trip alone, and expects to return to St. Louis about the middle of February.

THE STOCKHOLDERS of the Bloomington Stove Company, Bloomington, Ill., held a meeting Monday afternoon, January 7, the principal object of which was to reorganize under the new law and adopt a new charter, the old one having expired by limitation.

INGLING, MILLS & WELLS of Indianapolis, Ind., have issued an announcement to the trade, to the effect that they have purchased the stock and business of the Famous Stove Company at 135 South Meridian street of the city named, and will continue the wholesale stove business at that place under the same firm name. The trade will doubtless recognize the name of A. E. Wells as a former manager of the Cleveland Co-operative Stove Company and also of S. R. Wells of Indianapolis. The firm request that all orders be addressed to the Famous Stove Company, and all remittances due the Famous Stove Company prior to January 1 to Parkhurst Brothers & Co., Indianapolis, Ind.

THE NEW YEAR'S GREETING issued by Henry Gleason of 106 Beckman street, New York, is unique in its way. It consists of an extract from a trade paper relative to the business of Mr. Gleason during 1894, printed upon coarse brown wrapping paper, folded once and finished with rough edges. This is inclosed in an envelope of the same material, properly addressed and stamped.

DURING the past month agents of the Peninsular Stove Company of Detroit, Mich., have been giving in various parts of the State exhibitions demonstrating the practical merits of Peninsular wrought steel ranges. These displays have been made at Battle Creek, Grand Rapids, Flint, Ann Arbor, Saginaw, Bay City, West Bay City and other places of greater or less importance. In connection with the exhibitions there have been in several cases bread making contests, the prize at Flint being a $50 steel range, given by J. B. Wilson. The contestants were required to bake three loaves of bread and take them to the store of Mr. Wilson, where judges would decide to whom was entitled the prize. A free lunch and concert were given at his store every afternoon and evening, and after the prize had been awarded the bread was distributed to the poor. This contest brought out about 500 loaves of bread, the prize being awarded to Mrs. A. C. McCall. The contest at West Bay City produced about 650 loaves of bread, the range being won by Mrs. W. J. Hawkins. These exhibitions have served to increase the popularity of the company's goods and will doubtless be the means of making large sales.

THE STANDARD LIGHTING COMPANY of Cleveland, Ohio, are distributing a rather novel calendar for the new year in the shape of an easel carrying 12 white cards, upon which in red and black are printed the days of the week and month. These cards are carried in what may be called a pocket, the front of which is open exposing to view the letters and figures of the calendar. At the expiration of a month a card is taken out and placed at the back of the pack, this bringing to view the calendar for the succeeding month. Above and below the opening in the face of the easel, which is finished in imitation of leather, is the following inscription: "Cooking made easy by using the wonderful New Process stove manufactured only by the Standard Lighting Company, Cleveland, Ohio.

EUGENE MUNSELL & Co., 218 Water street, New York, are in the market this season with an extensive line of gasoline stoves. They have about completed a new catalogue of 26 pages, which will be mailed to the trade next week. The early pages are given up to illustrations and descriptions of the Standard Lighting Company's New Process, which proved a good seller with the Eastern agents last season. The Reliable Manhattan junior stoves are shown in various styles; also the company's two and three burner step juniors, which are new lines this season. The balance of the catalogue is devoted to low and high juniors, with lay down safety tanks and giant burners. The company also have a full line of rigid tank juniors which are known as the Junior Manhattan B.

S. T. DICKINSON severed his connection as manager of the Lehigh Stove & Mfg. Company, of Lehighton, Pa., on Saturday, January 12.

THE HIGHLAND FOUNDRY COMPANY of Boston, Mass., were the subject of a very interesting article which appeared in the issue of the Boston *Herald* of January 7. According to this authority the foundry was established in 1836 by George P. Bowers on the site occu-

pied by the present plant at 139 165 Pynchon street, then in the town of Roxbury, but now better known as Boston Highlands. The business continued to increase and a few years later Mr. Bowers associated with him Joseph Pratt, the firm name becoming Bowers & Pratt. In the year 1856 Mr. Bowers retired, and until 1863 the business was conducted under the name of Pratt & Co. In that year, however, C. E. Wentworth and J. H. Wentworth were admitted to partnership and the style of the firm was changed to Pratt & Wentworth, which continued until the organization of the existing company in 1876. The Highland Foundry Company are a Massachusetts corporation, their officers being William H. Towne, president, and Percival W. Elliott, treasurer and manager, who, with Captain Albert Cooper, George W. Elliott and Charles B. Wheelock, comprise the board of directors. In the article above referred to mention is made of the company's leading specialties and to the extensive business which the enterprise and ability of the management have built up.

In a recent issue of the *Sentinel*, published at Milwaukee, Wis., there was presented a short history of the leading industrial establishments in that place, among which is the Milwaukee Gas Stove Company, a young but successful concern, organized March 14, 1891. The establishment now occupies a four-story brick structure, covering an area 40 x 110 feet. The article describes at some length the specialties turned out by the company, and refers to the gratifying business which has been built up.

The Sill Stove Works of Rochester, N. Y., recently made a test trial of their new Sterling range, the results of which are described as follows by a local paper: The fire pot was filled with coal. The coal was then removed and kindling put in and the fire lighted. At exactly seven minutes past 12 o'olock p.m. the first baking, consisting of 16 full-sized loaves of bread dough, was put in the oven. From that time on until one barrel (196 pounds) of flour was baked the trial continued, the last baking being taken out at 17 minutes past 10 o'clock p.m.; 231 extra sized loaves of splendid bread were baked. There was not an ounce of coal used except the charge put in the fire pot before commencing.

Charles Noble & Co., Liberty Stove Works, Philadelphia, Pa., are distributing to their friends a handy little pocket diary and calendar combined. Besides a generous amount of space for recording engagements and memoranda pertaining to each day in the year, there are several pages ruled for the keeping of cash accounts, and others ruled especially for the registration of addresses and other memoranda of special importance. A feature of the diary is the tabulation of statistics in regard to populations of towns and States, and rules and regulations of the domestic postal service. The book is of convenient shape for the vest pocket, is neatly and strongly bound in leather, and unless we except the firm's complimentary card on the front of cover, contains nothing of an advertising character.

Wm. O'Keefe, who has represented the Excelsior Mfg. Company of St. Louis in Northern Missouri for some years past, has concluded to abandon selling Charter Oak stoves and ranges, and has associated himself with the Matuity Savings & Loan Company of St. Louis. As a token of esteem in which Mr. O'Keefe is held by the salesmen and other *attachés* of the Excelsior Mfg. Company, he was presented by them with a handsome gold watch chain, and accompanying it were the good wishes of the entire establishment for his success.

Jackson Evans Mfg. Company, St. Louis, Mo., on account of a steadily increasing business have been compelled to vacate their old quarters at 301 South Commercial street, and have moved to new quarters at 806 North Main street, which building was formerly occupied by Paddock-Hawley Iron Company. The building is 30 x 110 feet, four stories high, with basement. The basement will be utilized for unloading and cutting sheet iron, first floor office and warerooms, second and third floors manufacturing and fourth floor wareroom and japanning department. This company commenced the manufacture of Acme stove pipe elbows in St. Louis some six years ago, and have continued to increase their business yearly.

The Eclipse Stove Company, who were recently organized at Rockford, Ill., and who absorbed what was formerly the Van Wie Company, have occupied their new building and are now in active operation. The plant fronts on Race street, with the foundry on Rock River, which flows in the rear of the establishment. Directly in the rear of the office are the vaults for the storage of patterns, while to the left are the mounting, finishing and tin shops, equipped with all the necessary appliances for the proper conduct of the business. Between the foundry and mounting shop is the crating, storage and shipping department, from which goods can be loaded directly on to the cars, there being a railroad switch running up to the loading platforms. The leading spirit in this enterprise is George D. Roper of Rockford, who states that he has adopted the trade name "Eclipse," because he is determined not only to eclipse his former efforts, but those of his competitors.

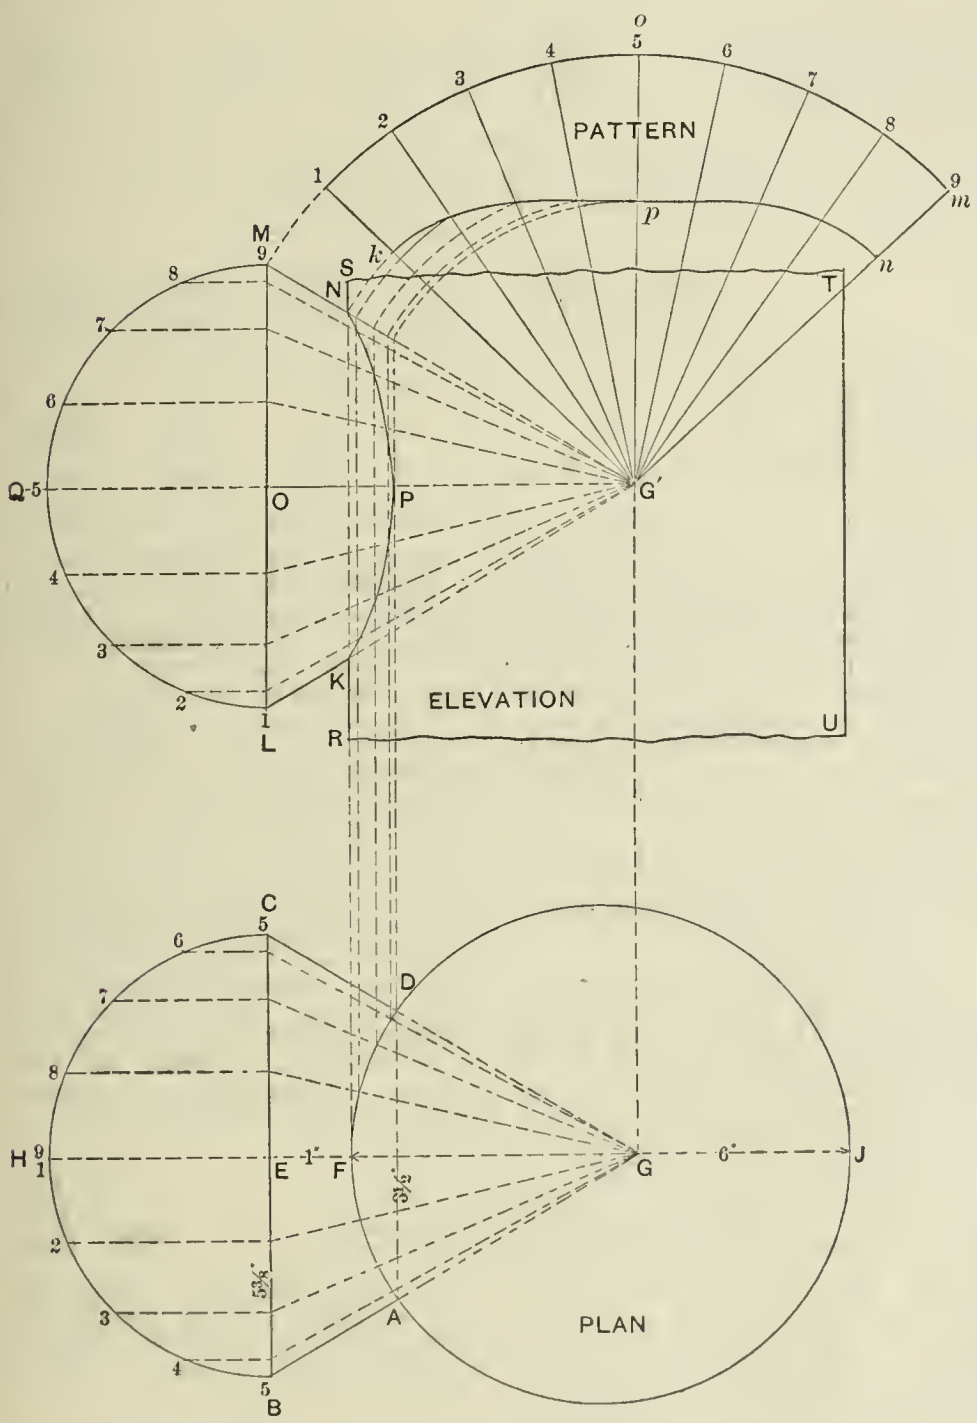
The Twin Burner Vapor Stove Company of St. Louis, Mo., have issued their annual catalogue for 1895, within the covers of which illustrations are presented of their leading lines of Twin Burner stoves. Attention is specially invited to their line of Process stoves for which strong claims are made. The catalogue consists of 20 pages, is printed in an ink of bluish tint and carries illustrations of an interesting assortment of specialties. The leading place is given to the Twin Burner Process cabinet, one size of which is new for 1895. The Twin Burner Process is next considered, and is shown with two and three burners with step, and two and three burners without. There are also presented illustrations of Twin Burner high and low juniors, together with directions for taking care of independent burner gasoline stoves. A four-page folder accompanying the catalogue shows the company's new line of high and low junior stoves with stationary tanks.

Charles E Coleman, representing Eugene Munsell & Co., 218 Water street, New York, has been notifying dealers in the territory which he covers that he will call upon them in a few days to take their orders and talk over matters for 1895. The notification is in the shape of an illustrated circular, the address side of which is bright red while the other is white. It is folded in such a way as to be mailable and conceal what is within. The notice states that for the season of 1895 many new features have been added to the already extensive and modern lines of Manhattan ranges and stoves, and that Mr. Coleman feels sure he can interest all upon whom he may call. He requests that dealers withhold their orders until he visits them.

The Michigan Stove Company are issuing this year very artistic advance notices of the coming of their traveling representatives. One now lying before us is a four-page circular of heavy uncalendered paper, which bears on the outside page a striking illustration by Will H. Bradley, the famous pen and ink artist, whose work is now exciting a *furor* in art circles. A deep crimson border brings out the black outlines of the illustration very effectively. The inside pages are printed in antique type, formerly known as "black letter," with the salesman's name in crimson. The company are also circulating beautifully printed and richly illustrated circulars descriptive of the Columbian Garland steel range, which is made in every style and size.

The Western Stove & Mfg. Company of Milwaukee, Wis., have established a Chicago office in charge of T. J. Duffy, Jr., in Rooms 73 and 74 at 88 and 90 Washington street. They have made an excellent selection in their Chicago representative as he is well and favorably known in the local stove trade.

The Joseph Bell Stove & Range Company of Muncie, Ind., and with branch house at Wheeling, W. Va., have favored their friends in the trade with a very attractive calendar for the new year. The heavy piece of white cardboard is embellished with a beautiful reproduction of a picture by C. Schultz entitled "An Old Water Mill in Germany." This occupies fully one-half of the card, below which is advertising matter relative to the company and the goods which they manufacture. At the bottom are the 12 leaves carrying the calendar proper. The printing is in bold black letters and figures upon a white ground and shows in addition to the days of the week and month the various phases of the moon.



At the annual meeting of the stockholders of the Bellaire Stove Company, Bellaire, Ohio, held on Tuesday, January 15, the old board of officers and directors was re-elected. The officers are: H. Roemer, president and treasurer; J. B. Montgomery, vice-president; E. H. Rider, secretary, and Robert Johnston, manager. The reports presented at the meeting showed that while the company did not make a fortune during the past year the volume of trade was better than generally expected. The demand for the company's goods is encouraging and the new year opens with bright prospects. Ross Reed will represent the company on the road during 1895.

The Aqueduct Commissioners of New York City have gone through the preliminaries for purchasing about 300 acres of land at Jerome Park for a new reservoir. The land will cost about $3,000,000, and it is calculated that the reservoir will cost about $3,500,000. It will hold about 1,500,000,000 gallons of water, or about half as much again as the present large reservoir in Central Park. It is calculated that the work will be completed in about five or six years.

THE TIN SHOP.

Pattern of a Frustum of a Cone Intersecting a Cylinder.

From W. E. W., *Grand Rapids, Mich.*—I have been at work on a pattern for some time, and am unable to describe it correctly. The pattern desired is for a flaring article to join a cylinder. As shown in plan the diameter of cylinder F J is 6 inches. The diameter of frustum of cone is 5⅝ inches at B C, 2½ inches at A D and the projection of E F is 1 inch.

Pattern of a Frustum of a Cone Intersecting a Cylinder.—Fig. 1.—*Plan, Elevation and Pattern.*

Answer.—In the plan, Fig. 1, let A B C D F reprent the section of cone, B C G the cone from which the section is cut, B H C the semicircle representing the half profile of cone at its base and A D J the cylinder. In line with the cylinder in plan draw the elevation, as shown by R S T U. With the T-square placed parallel to the sides of the pipe, carry a line from the point G in plan to any convenient point, as G′ of elevation. At right angles to G G′ draw G′ Q, indefinitely, and extend B C through Q G′, cutting same at O. With O as center, and E C of plan as radius, describe the semicircle L Q M, representing one-half of the profile of cone at the larger end. Divide L Q M into any convenient number of equal parts, as indicated by the small figures. From the points thus obtained carry lines at right angles to L M, cutting that line as indicated. From the points thus obtained in L M carry lines to the apex G′, as indicated by the dotted lines in the engraving. Divide B H C into the same number of equal parts as was L Q M, and from the points thus obtained carry lines at right angles to B C, cutting that line as indicated. From the points thus obtained in B C carry lines to the apex G, cutting the plan of pipe as shown. With the blade of the T-square placed parallel with G G′, and brought successively against the points thus established in the plan of the pipe, cut lines of corresponding number drawn from the points in L M to the apex G′, as indicated from K to N, and extend these lines to M G′. A line traced through these points of intersection, as shown

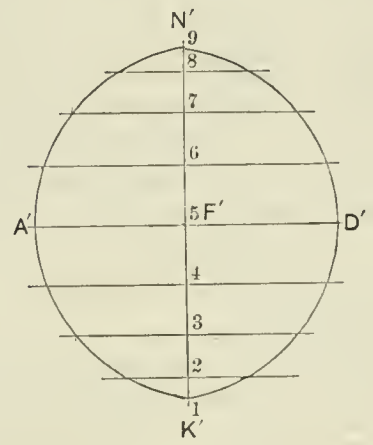


Fig. 2.—*Shape of Opening in Cylinder.*

by K P N, represents the intersection of cone with cylinder in elevation, as shown by A F D in plan.

For the pattern, proceed as follows: From G′ as center, with G′ M′ as radius, describe an arc as indicated by *l o m*, and starting from *l*, step off the stretchout of the half profile L Q M, as indicated by the small figures. If the entire pattern is required in one piece extend the arc *l o m*, and from *m* set off a duplicate of *l o m*. From the points thus obtained draw radial lines to G′, as indicated. Then with G′ as center, and with radii corresponding to the points established in M G′, describe arcs, producing them until they cut lines of corresponding number drawn from G′. A line traced through these points of intersection, as shown by *k p n*, will give the pattern of part of article shown in elevation by L M N P K. For the shape of opening in the cylinder corresponding to the cut A F D of plan, or K P N of elevation, proceed as follows: Draw N′ K′ of Fig.

2, and through the center F′ draw the perpendicular A′ D′. From F′ set off on N′ K′ the length of lines drawn through O P of elevation, intersecting the miter line N P K. Through the points thus obtained in N′ K′ draw lines parallel with A′ D′. Measuring in each instance from the line N′ K′, set off on each side of it the distance from F in plan to lines of corresponding number drawn from C B to G. Through the points thus obtained trace a line, as indicated by A′ N′ D′ K′.

The Resistance to Corrosion of Some Light Aluminum Alloys.*

BY JOSEPH W. RICHARDS, PH.D.

It is well known that pure aluminum is a comparatively soft metal, and that for many mechanical purposes where strength is a prime consideration it is strengthened and hardened by being alloyed with a small proportion of some other metal, such as copper, nickel, silver, German silver, or titanium. While pure aluminum has a tensile strength in castings of 15,000 pounds per square inch, and in sheet of 25,000 pounds, the addition of 5 per cent. of nickel or German silver or 2 per cent. of titanium increases the strength to 20,000–30,000 pounds in castings and 40,000–50,000 pounds in sheet. At the same time as the strength is thus increased from 50 to 100 per cent., the specific gravity is not increased over 5 per cent.; all of these light, strong alloys being lighter than 3. An American firm making aluminum bicycles uses an alloy containing about 8 per cent. of copper and 12 per cent. of zinc, giving them castings of great rigidity.

The object of the tests about to be enumerated was to determine the relative resistance of some of these light alloys to corrosion. The strips of rolled metal were immersed in the following liquids:

1. *Dilute Caustic Potash*, 3 per cent.—The behavior of the alloys in this solution shows their relative resistance to alkali, such as in strong soaps, &c., and shows the suitability of the alloys for laundry purposes. Solution cold.

2. *Dilute Hydrochloric Acid*, 3 per cent.—This is the only acid which attacks aluminum rapidly. Solution cold.

3. *Concentrated Nitric Acid.*—Shows the suitability of the alloys for replacing platinum in the Grove battery. Acid cold.

4. *Strong Acetic Acid.*—Shows the resistance of the alloys against vinegar, and bears directly on the uses of the metal for pickling kettles, &c. Solution at 60° C. = 140° F.

5. *Strong Solution of Common Salt.*—This shows the resistance to the agent present continually in cooking utensils. It also shows light on the suitability of aluminum for the metal cases in which artificial ice is made, a use for which its great heat conductivity would particularly fit it. Solution at 65° C. = 150° F.

6. *Solution of Carbonic Acid Gas*—Aluminum has been suggested for trimmings on soda water fountains and for the metal cups for holding soda water glasses. The action of water charged with CO^2 would also correspond to the action of rain water and in general to exposure out of doors. Solution at 25° C. = 77° F.

Table I.—Relative Resistance to Corrosion (Pure Al = 100).

	Caustic potash.	Hydrochloric acid.	Nitric acid.	Salt.	Acetic acid.	Carbonic acid water.
3 per cent. copper	13.0	10.8	26.2	37	41.2	not corroded
3 per cent. German silver	1.4	4.4	9.8	78	26.0	133.3
3 per cent. nickel	5.9	3.2	11.3	31	20.7	30.8
2 per cent. titanium	47.0	133.3	51.9	63	80.5	not corroded
99 per cent. aluminum	100.0	100.0	100.0	100	100.0	100.0

Table II.—Actual Losses Per Day (in Milligrams per Square Centimeter of Surface).

	Caustic potash.	Hydrochloric acid.	Nitric acid.	Salt.	Acetic acid.	Carbonic acid water.
3 per cent. copper	265.0	53.3	36.1	0.1	0.4	0.0
3 per cent. German silver	1,534.4	130.6	97.7	0.05	0.6	0.01
3 per cent. nickel	580.3	180.0	83.0	0.13	0.75	0.04
2 per cent. titanium	73.4	4.3	18.6	0.06	0.20	0.0
99 per cent. aluminum	34.6	5.8	9.6	0 04	0.15	0.01

Table III.—Time Which Would be Required by the Solution in Eating Through the Walls of a Vessel 1 Mm. (1/25 inch) in Thickness.

	Dilute. potash. Days.	Hrs.	Dilute. hydrochloric acid. Days.	Hrs.	Conc. nitric acid. Days.	Hrs.	Strong. acct. ac. Days.	Strong. salt. Days.	Saturated. carbonic acid water. Days.
3 per cent. copper	1	2	5	7	7	20	705	2,820	. ....
3 per cent. German silver	..	4	2	5	2	22	467	5,600	28,000
3 per cent. nickel	..	12	1	13	3	8	379	2,130	7,000
2 per cent. titanium	3	20	64	..	14	20	1,375	4,550	.....
99.9 per cent. aluminum	7	20	46	22	28	8	1,810	6,800	27,000

Remarks on the Tables.—For bath-tubs, wash basins, laundry tubs, wash boilers, and any use in which the alloys come in contact with alkali, the pure metal resists corrosion far better than any of the alloys examined. At the same time, if greater strength is required, the copper alloy stands next in suitability and possesses the advantage of casting with less shrinkage than pure aluminum.

For purposes where free hydrochloric acid may accidentally be encountered, the titanium alloy recommends itself as far superior to the other alloys, and even to the pure metal.

For use in nitric acid, the pure metal stands first, and it would be a fair conclusion that the purer it is the greater will be its resistance. It would, therefore, be preferable to obtain the very purest aluminum for making battery plates, such as the Pittsburgh Reduction Company's 99.9 per cent. quality. A sheet of such metal $\frac{1}{10}$ inch in thickness would bear over a month constant immersion in the concentrated acid.

In strong acetic acid the alloys all resist well, but the pure aluminum best. If it is necessary to have considerable strength, the titanium alloy is the best. The use of such alloys for steam jacketed kettles in pickle and vinegar works, also for evaporating dishes, &c., in chemical works, is of rapidly growing importance.

In strong salt solution, pure aluminum is best, but the German silver alloy stands highest among the alloys.

Since this alloy is of a fine color, strong and quite elastic, its use would appear advantageous in cooking utensils, but especially for the cans in ice cream freezers and the large rectangular vessels in which artificial ice is frozen. Aluminum stands next to copper and silver in heat conductivity, and its use for the last mentioned purpose would insure a very rapid flow of heat from the contents of the cans, while the innocuity of the metal would be an additional point of superiority over the tin or galvanized iron vessels now used.

For out of door exposure, as shown by the resistance to water charged with carbonic acid, the titanium or copper alloys are to be recommended. They are of about equal strength, but the copper alloy has the best color.

There are numerous purposes to which aluminum can be applied where the general requirements are fine color, strength, springiness and hardness, without particular reference to the action of the above mentioned corroding agents. Such are, for instance, penholders, paper cutters, pocket rules, match boxes, cigar cases, combs, tongs, watch and key chains, field glasses, surveyors' instruments, mariners' sextants, and many others. For all such purposes, the German silver alloy can be recommended as being the best adapted. Its mechanical properties have been determined by the writer, as follows:

	Cast.	Rolled.
Specific gravity	2.73	2.83
	Lbs.	Lbs.
Elastic limit	20,500*	40,000†
Tensile strength	22,450*	42,040†

The color of this alloy is whiter than pure aluminum; it is considerably harder, therefore stands wear better, and in thin sheets is almost as elastic as steel.

The right of way for an electric railway from Merced, Cal., to the Yosemite Valley is reported to have been secured. The power is to be established at three points on the Merced River. The new road will be broad gauge and adapted for both passengers and traffic. A contract for the construction of the line is said to have been taken by the Pacific Improvement Company. The new company is capitalized at $2,500,000.

* Read at the stated meeting of the Chemical Section of the Franklin Institute, held December 18, 1894.

*Test of specimens, prepared by the writer, made on the United States testing machine at Watertown Arsenal.

†Specimens prepared by the writer, rolled hard, tested by Tinius Olsen, Philadelphia.

TRADE REPORT.

The Iron Market.

The prospect of a heavy consumption of rolling mill products is very good. While the big work does not go into the shops for a month or two, recent developments seem to foreshadow a modest recovery in prices by spring. For the present, low prices continue to prevail all along the line on all material for prompt delivery.

Pig Iron.—The market in New York continues quiet, although a fair movement is progressing. So far as can be learned the advance in rates on Pig Iron from Southern furnaces of 25¢ ℔ ton is in force. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

There is a slightly improved demand reported from the Philadelphia market and prices of Foundry and Mill Irons are, if anything, steadier than they were a week ago. Quotations vary according to circumstances, but $10.25 may be considered a bottom figure for No. 3 Iron, $10.75 for No. 2 Plain, $11.25 for No. 2 X, and $12.25 for No. 1 X. Standard and favorite brands command more money, probably $11.75 for No. 2 X and from $12.50 for No. 1 to 50¢ above that figure, according to quality required. The demand is fair, but the supply is larger than it has been, in consequence of which the outlook in regard to prices is somewhat uncertain. Sales are usually at about the figures quoted below, namely:

Standard No. 1 Foundry X	$12 25	@	$12.75
Standard No. 2 Foundry X	11.50	@	11.75
No. 2 Plain	10.75	@	11.00
No. 1 Soft	11.50	@	11.75
No. 2 Soft	10.75	@	11.00

The only item of importance reported from the Chicago Pig Iron market is the statement that the freight on Connellsville Coke is expected to be reduced about 10¢ ℔ ton on February 1. Sales of Pig Iron have been small and inquiries are light, but shipments from local furnaces are quite heavy, as the local companies are well fixed for orders. Southern iron is reported to be in better demand since prices have been modified, so that they are now more nearly on an equality with prices of Northern brands of the same grade. Lake Superior Charcoal is quiet, the sales of the week being confined to small quantities. Quotations are as follows, for cash:

Lake Superior Charcoal	$13.00	@	$14.00
Local Coke Foundry, No. 1	10.25	@	10.50
Local Coke Foundry, No. 2	9.75	@	10.00
Local Coke Foundry No. 3	9.50	@	9.75
Local Scotch	10.50	@	11.00
Ohio Strong Softeners No. 1	12.50	@	13.00
Southern Silvery, No. 1	11.50	@	11.75
Southern Silvery, No. 2	11.25	@	11.50
Southern Coke, No. 2	10.00	@	10.50
Southern Coke, No. 3	9.75	@	10.25
Southern, No. 1, Soft	10.00	@	10.50
Southern, No. 2, Soft	9.75	@	10.25

There is no improvement in either demand or prices to be noted in the Pittsburgh district for foundry Irons. The lower quotations given herewith are occasionally shaded for desirable orders. Quotations are given as follows:

No. 1 Foundry	$10.50	@	$10.65 Cash
No. 2 Foundry	10.00	@	10.25 "

Pipe works have continued the largest melters of Pig Iron in the Cincinnati district for the past few weeks, and further sales of Pig Iron aggregating about 4000 tons have been recorded during the week under review. With this exception the sales have been confined to small amounts, although the aggregate transactions form a very fair volume of business for this season. While large transactions have been the exception rather than the rule, the demand for small lots has been more general and extended, and for prompt delivery there has been little change in the tenor of the market. Large Southern companies have continued to hold firmly at full prices. Others have refused to shade established prices. Smaller companies, however, have continued to take current orders offered on a basis of inside quotations. Quotations are given as follows:

Southern Coke, No. 1	$9.75	@	$10.00
Southern Coke, No. 2	9.00	@	9.25
Southern Coke, No. 3	8.50	@	8.75
Ohio Soft Stone Coal, No. 1	14.50	@	15.00
Ohio Soft Stone Coal, No. 2	14.00	@	14.50
Lake Superior Coke, No. 1	11.75	@	12.25
Lake Superior Coke, No. 2	10.75	@	11.50
Hanging Rock Charcoal, No. 1	16.00	@	16.50
Hanging Rock Charcoal, No. 2	15.50	@	16.00
Tennessee Charcoal, No. 1	13.00	@	13.50
Tennessee Charcoal, No. 2	12.00	@	12.50
Bessemer	11.65	@	12.00
Standard Southern Car Wheel	15.75	@	16.75
Lake Superior Car Wheel and Malleable	14.25	@	14.75

The St. Louis market fails to show any material change. Orders do not average over 100 or 200 ton lots, although some manufacturers are reported to be at present figuring on much larger quantities. The furnaces are shipping considerable quantities of Iron on old contracts, so that their stocks do not show any material increase. The situation is not nearly so discouraging as it was two months since, and the improvement, though slight, is a welcome one. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.50	@	$10.75
Southern Coke, No. 2 Foundry	9.75	@	10.00
Southern Coke, No. 3 Foundry	9.25	@	9.50

Metal Market.

Pig Tin.—In the earlier portion of the week wholesale prices declined to the extent of about ¼¢ ℔ lb. The downward movement was an almost unbroken one for several days, and indications suggested that it was engineered by leading "bears" in London, who are sparing no efforts to force the syndicate to throw off its heavy load. Their action has been materially aided by the weight of heavy supplies. Later in the week the market assumed a firmer aspect, owing to a sharp advance in London, due to reports of light December shipments from the Straits. The jobbing demand has been moderate, and prices for small lots from store are rather easier, 15¢ ℔ lb being the ruling quotation for Straits Pig.

Copper.—Considerable business has been done and the market retains a firm tone throughout. Offerings are moderate and prices keep very steady. The export movement also has been large enough of late to absorb a substantial amount of the metal. Inquiry and small orders among the jobbing houses have been somewhat larger. Prices for small parcels of Lake Ingot are made on a basis of about 10¾¢ ℔ lb. The exports of Copper from the United States during November and the 11 months ending November 30 are specified as follows in the report of the Bureau of Statistics:

Ore.	November. 1894. Tons.	November. 1893. Tons.	11 Months. 1894. Tons.	11 Months. 1893. Tons.
To United Kingdom	184	2,011	1,854	40,407
To Germany	....	....	1	1,043
To other countries	...	....	.....	. ...
Totals	184	2,011	1,855	41,450

Ingots, bars and old.	November. 1894. Pounds.	November. 1893. Pounds.
To United Kingdom	3,807,555	5,715,564
To Germany	700,641	1,681,969
To France	1,257,704	3,103,435
To other Europe	2,826,876	7,036,713
To Br. No. America	30,630	161,640
To Mexico	11,357	.....
To West Indies and Bermuda	.....	3,400
To other countries	. ...	10,000
Totals	8,634,763	17,712,721

Ingots, bars and old	Eleven months. 1894. Pounds.	Eleven months. 1893. Pounds.
To United Kingdom	62,176,894	33,636,042
To Germany	19,714,385	15,796,167
To France	17,506,383	25,259,573
To other Europe	50,059,520	44,186,789
To British North America	285,162	578,937
To Mexico	198,080	85,507
To West Indies and Bermuda	7,481	15,704
To other countries	6,208	43,600
Totals	149,954,113	119,602,319

Sheet Copper.—Rather more interest in Cornice Copper is noted and inquiry has increased in volume. Orders are, however, still on a moderate scale and little or no material is being purchased by consumers for stock. Prices for small lots from store are firm on a net basis of 15¢ ℔ lb.

Pig Lead.—Early in the week a lively market was experienced and some 1500 tons or more changed hands, wholesale prices for common Western being carried up ⅛¢ ℔ lb, owing to the shutdown of Idaho mines and consequent reserved offerings. The market closed very firm in tone. The consumptive demand has been fairly active. Jobbing prices for American Pig rule at 3⅜¢ @ 3½¢ ℔ lb. Bar Lead, in small lots, is quoted at 4¢ @ 4⅛¢.

Lead Pipe and Sheet.—Consumers of manufactured Lead and plumbers' supplies have shown rather more interest in buying during the week. Jobbing houses in this city report considerable energy, but no very material improvement in the demand is looked for before the early spring. Prices in this section are generally held firmly to the list.

Spelter.—In the market for this metal the situation is practically the same as it has been for several weeks.

Transactions here continue to be on a moderate scale, the demand does not increase perceptibly, and the moderate business passing is chiefly at old prices. Western in small lots is quoted at 4¢ @ 4¼¢, with the inside figure for inferior brands.

Antimony.—The jobbing movement continues fair. Prices remain at about 8¢ for Hallett's and 9¼¢ for Cookson's.

Nickel.—We quote at 37¢ @ 42¢, according to size of lot, &c.

Tin Plate.—The event of the week has been the announcement that the wages dispute in the West has been settled, the Tin Plate workers accepting a reduction ranging from 12½ % to 15 %. This will lead to a renewal of activity among the domestic works. The market, as a whole, remains in a condition of irregularity, although some improvement in inquiry is noted among the jobbing houses. Small orders have been rather larger in their aggregate volume, but the amount of business doing still lays behind the average for the season. The outlook is not regarded as presenting any features of special encouragement. Canners of most varieties of vegetables have had such poor return from their enormous packs of last year that they intend to curtail operations the coming season, and are, therefore, very indifferent buyers of Coke Plates. Fruit canners are in not much better shape, and meat canners are not enjoying enviable experience. Competition is keen and keeps prices low and irregular.

A special London cable dispatch of January 16 to *The Iron Age* reports on the British Tin Plate market as follows: Tin Plate is without change for the better. Prices for Cokes are three half-pence lower. Business at the quarterly meetings was limited mostly to small lots. Reports went to show that the outlook is without improvement. Makers depend mostly on early reduction in workmen's wages to give relief. Present values do not remunerate. Buyers admit that prices are too low, but take no advantage of the cheap rates. One of the makers proposes raising prices by combine. Non-associated makers thought this not practicable, owing to possibility of increasing American competition. The large Eastern demand for Wasters continues. The quotations, f.o.b. Swansea, are as follows:

Bessemer Cokes, IC 14 x 20.	... @ 9/4½
Siemens Cokes, IC 14 x 20.....	9/7½ @ 9/10½
J. B. Steel Cokes, IC 14 x 20 ...	....
Ternes, 20 x 28.....	18/6 @ 21/
Charcoals, IC 14 x 20.....	10/6 @ 12/6

Chicago Report.

Scrap. — Business continues quiet. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap.....	$7.00	....
Machinery Cast.....	6.00	....
Malleable Cast.....	5.50	....

CONDITION OF THE

Hardware Trade.

DURING the past week a good many travelers have gone out in the interests of their houses, but it is as yet too early to hear from them to any great extent in the way of orders. Others will be entering the field during the next week or two, and under the stimulus of the efforts thus put forth there will undoubtedly be an increase in the volume of business. Some orders are now being received from jobbers and retailers, however, to complete their assortments, and there is a perceptible increase in the demand. These orders, with scarcely an exception, indicate that stocks are exceptionally light and in some cases broken. The trade, however, are buying carefully and are not at all disposed to speculate. The present month is one when a good many changes in discounts and lists are expected, but this year they were perhaps less than usual. Prices on Hardware generally are rather irregular and the tone of the market is not strong. It is, however, expected that there will be a good volume of business during the season, and the condition on the whole is referred to as showing continued, though not very rapid, improvement, which has characterized the market for some time.

Advices from Chicago.— The Shelf Hardware trade has opened up very satisfactorily with those houses whose salesmen are now out on the road. A few jobbers kept their men in a little later, and consequently have not yet begun to thoroughly feel the pulse of the trade. Country merchants, so far as they have been seen, appear to be in the humor now to stock up to some extent, and their orders are much better than at the beginning of last year. The demand covers all kinds of goods in straight Hardware, as well as staples. The situation is a little clouded, however, by the efforts of some local jobbers to move their staple goods a little faster by making especially low prices. Coming at this time the weakening in staple goods may have the effect of causing buyers to hold off to see if the bottom of the market has been reached. Tinware and House Furnishing Goods are in particularly excellent demand. Orders are larger than for a long time and buyers are urgently requesting goods to be shipped promptly. The heavy Hardware trade has also opened up nicely and orders now coming in are well assorted. Collections are fair.

Notes on Prices.

Wire Nails.—There has been little change in the condition of the Wire Nail market during the past week. There is, however, increased inquiry and more orders have been placed, the volume of business being fair. There is little disposition on the part of the trade to purchase in a speculative way, although the prices ruling are conceded to be low. Small lots from store in New York are held at $1.15.

Advices from Chicago.—Manufacturers report a considerable improvement in the inquiry and a very much better run of actual orders. The trade in districts outside of Chicago appears to be considerably larger than in this immediate vicinity. The jobbing trade has been considerably disturbed by the low prices made by one large house for private reasons. The usual jobbing quotation for carloads is $1, f.o.b. cars Joliet, or $1.05 for small quantities, but the house referred to has put this rate down to manufacturers' lowest prices for large lots.

Cut Nails.—The Cut Nail Market is quiet, though there is some increase in the volume of business. Prices are unchanged. Small lots from store at New York are held at 90 to 95 cents.

Advices from Chicago.—This trade is moving along in about the same fashion as previously reported. Orders are coming in moderately well, being usually confined to carload lots. Prices are unchanged at $1 for small lots from stock.

Barb Wire.—The manufacturers of Barb Wire report some increase in the volume of business since the opening of the year, but trade on the whole is quiet. Prices are without change, but the tone of the market is not especially strong. Concessions which have recently been made are still being offered, and there are rumors of some sales at low figures. The market is represented by the quotation of $1.80 to $1.85 for Four Point Galvanized, in carload lots at mill.

Advices from Chicago. — Manufacturers' orders, so far as can be learned, have been of a moderate character only during the week and prices are running the same as previously. The standard makes of Barb Wire appear to be completely unaffected by the low prices made by one concern, which has had occasional notice in these reports. Jobbers are making regular quotations of $1.60, f.o.b. cars Joliet, for carloads of Painted, and $1.95 for Galvanized, but a large local jobbing house has introduced the same policy in the Barb Wire trade as above referred to in the Wire Nail trade, and is making a cut to actual manufacturers' prices.

Skate Sharpener.—The Skate Sharpener illustrated in our last issue as put on the market by Banker & White, George M. Matteson, agent, 111 Duane street, New York, is sold to the trade at $1.75 per dozen and $18 per gross.

Can Opener and Cover.—The Eclipse Can Opener and Cover, made by the Brooklyn Novelty Company, 1055 Madi-

son street, Brooklyn, N. Y., of which an illustrated description was given in our issue of January 12, is designed to retail for 10 cents each and is sold to jobbers at $7.50 per gross. The manufacturers state that with care the opener and cover will last an almost indefinite time.

Binder Twine.—The Binder Twine market is characterized by a lack of activity. Buyers as a rule are holding off, although a good many orders have been placed. Manufacturers of twine outside the Trust are not, as a rule, pushing the manufacture or sale of their product, but are rather awaiting the results of the marketing, by the Western Twine Company, of the several thousand tons of Binder Twine which has been held by bankers as collateral, and which was not disposed of last season. Some of those familiar with Binder Twine express doubts as to the value of held-over Twine in comparison with that of this year's make. The market is in an unsettled condition regarding prices, and quotations from the representatives of various factories show quite a range for the same class of goods. The market is represented by the following quotations, the extremes, as a rule, indicating the difference in cost between car lots and less than car lots; in some cases, however, the lowest and highest prices are made for the same quantity of twine by different manufacturers:

Sisal, 5 to 5½ cents per pound.
Standard, 5½ to 6½ cents per pound.
Manila, 6 to 6½ cents per pound.
Pure Manila, 7 to 7½ cents per pound.

Manufacturers agree that there is little or no money in making and selling Twine at present prices, and prefer to utilize their plants for the manufacture of rope. This feeling is so pronounced that one factory proposes working their Twine up into rope, rather than market it at lower prices than those ruling. Any advance or decline in the price of raw material will affect the price of Binder Twine, as the prices for the finished product are based upon the cost of fiber.

Eave Troughs.—We present below the revised price-list adopted at the first regular meeting of the United States Eave Trough and Conductor Pipe Association, held at Cincinnati, January 9:

Galvanized Lap Joint Eave Trough.

No.			Per foot.
3	6-inch	girt	$0.13
3½	7	"	.14
4	8	"	.16
5	10	"	.19
6	12	"	.23
7	14	"	.27
8	16	"	.30

Slip Joint, 1 cent per foot higher than Lap Joint.

Double Bead, 3 cents per foot extra and must have 2 inches more girt.

For heavier than No. 28 gauge add following: Nos. 27, 1 cent; 26, 2 cents; 24, 4 cents; 22, 10 cents; 20, 18 cents.

Tin Eave Trough.

No.			IC Terne. Per foot.	IX Terne. Per foot.
3	6-inch	girt	$0.08	$0.09
3½	7	"	.09	.10
4	8	"	.10	.11
5	10	"	.12	.13
6	12	"	.14	.15
7	14	"	.16	.17
8	16	"	.19	.20

Slip Joint, 1 cent per foot extra.

No change in list price on Conductor Pipes and Eave Trough Miters.

Wringers.—The following are the prices of the National Wringer & Mfg. Company, Canton, Ohio, on the line of Wringers which they are putting on the market. Terms 60 days, 2 per cent discount for cash in ten days:

	Per dozen.
No. 20, Erie, 10-inch	$22.50
No. 30, " 11 "	25 00
No. 55, King, 11 "	27.00
No. 2, "77," 10 "	13.75
No. 2, Zenith, 10 "	14.00
No. 3, " 11 "	18.00
No. 4, " 12 "	21.00
No. 40, Prime, 10 "	16 75
No. 50, " 11 "	19.00
No. 66, Columbia, 11 x 1¾ inches	26.10
No. 99, Pittsburgh, 11 x 2 inches	29.00
No. 45, King, 10-inch	24.50
No. 65, " 11 x 2 inches	32.00

The company quote their Daisy Rat Trap at $8.50 per gross.

Stove Bolts.—The market for Stove Bolts has for some time been somewhat irregular, and at a meeting of the manufacturers last week a reduction of 10 per cent. was made in the price. The quotation on these goods is now 70 and 10 per cent. discount.

Tinware.—There are some indications of an understanding between the manufacturers of Tinware, as there is more uniformity in prices, some of them quoting substantially the same figures. The market in this line is deserving the careful attention of the trade, as it is regarded as not unlikely that prices may be somewhat higher, and already it is intimated that some extreme quotations have been withdrawn.

Double Pointed Tacks.—The manufacturers of Double Pointed Tacks have recently been conferring, and as a result the market has a better tone, with a slight advance in prices.

White Lead.—The market is in somewhat uncertain shape and disturbed more or less by foreign competition, present and prospective. There is also some difference of opinion regarding the attitude of home producing interests that tends to complicate matters more or less. Naturally, large buyers proceed slowly in the matter of placing orders and the smaller trade buy moderately, as usual at this season of the year. List prices remain unchanged, and terms are also as they have been for some time past. There are rumors, however, of "cut rates" in some sections and of very low quotations on certain of the better class of mixed Lead.

Old Metals.—Business is quiet and prices somewhat irregular, depending largely on actual requirements and the desire of holders to sell. The following quotations represent the current rates paid by dealers in this city:

Heavy Copper	℔	7 ¢
Light and Tinned Copper	℔	6½¢
Heavy Brass	℔	4¾¢
Light Brass	℔	3¾¢
Lead	℔	2¾¢
Tea Lead	℔	2½¢
Zinc	℔	2⅛¢
No. 1 Pewter	℔	10 ¢
No. 2 Pewter	℔	5½¢
Wrought Scrap Iron,	℔	gross ton $7.50 @ $8.00
Heavy Cast Scrap	℔	gross ton 7.50 @ 8.50
Stove Plate Scrap	℔	gross ton 5.00
Burnt Iron	℔	gross ton 3.00

Old Rags, Paper, &c.—Demand is fair and dealers' purchasing prices substantially the same as those quoted last week, namely:

No 1 White Rags	℔	3 @ 3¼¢
No. 2 White Rags	℔	2¼ @ 2½¢
Mixed Rags	℔	¾ @ 1 ¢
Blues and 3ds	℔	1⅛ @ 1⅜¢
Hard Sized White Shavings	℔	2⅛ @ 2¼¢
No. 1 White Book Shavings	℔	1¾ @ 2⅛¢
No. 2 White Book Shavings	℔	1 @ 1⅛¢
Light Book Shavings	℔	⅝¢
No. 1 Mixed Shavings	℔	¾ @ 1 ¢
No. 2 Mixed Shavings	℔	⅝ @ ¾¢
No. 1 Printed Books	℔	1 @ 1¼¢
Ordinary Mixed Books	℔	½ @ ¾¢
Newspapers	℔	2-5¢
No. 1 Manila Paper	℔	¾ @ 1 ¢
No. 2 Manila Paper	℔	⅝ @ ¾¢
Bogus Paper	℔	½¢
Common Paper	℔	¼ @ 3-5¢
Straw Chips	℔	⅜¢
Binders' Clippings	℔	½¢
Jute Butts	℔	1½ @ 1¾¢
No. 1 Jute Bagging	℔	1 @ 1¼¢
Mixed Bagging	℔	¾ @ 1 ¢
No. 2 Bagging	℔	½ @ ⅝¢
Hemp Twine	℔	2 @ 2¼¢
Manila Rope	℔	2 @ 2¼¢
Jute Rope	℔	1½ @ 1¾¢
Mixed Rope	℔	¾ @ ⅞¢

Old Rubber.—Business has eased off somewhat, and prices are rather weaker. The following quotations represent about the prices paid by dealers, New York delivery:

Car Springs, ton lots, ℔	$0.03¾ @ .04
Rubber Shoes, carloads, delivered at factory, ℔	@ .05¼
Rubber Shoes, less than carloads, ℔	@ .04¾
White Wringer Rolls, ℔	@ .03⅞
White Syringes, ℔	@ .03⅞

Do Not Be Afraid to Talk.

"A man should talk about what he knows, and only about that. Then he may say something worth hearing. As regards other things, he should hold his tongue, and then he won't make a fool of himself." So says the parlor oracle, and shuts his mouth with a snap. And no doubt the logical position is, or appears to be, a very strong one. No man can know more than a very few things thoroughly. A man can only say what is worth hearing on things he knows thoroughly. A man should not talk except he says things worth hearing. Therefore, a man should not be discursive, and should confine himself to his own subjects.

Such is the outline of the syllogisms by which the discursive talker is put down, pulverized, and, if not reduced to silence, at any rate conclusively proved to be a babbling jackass. But, in spite of the excellence of the logic, we all know that in fact the discursive talker can be, and often is, a most delightful talker, and that in spite of all the rules and all the schools, one may gain a great deal more, not only of amusement, but of information, from the man who is not afraid of talking of anything in heaven above or the earth beneath than from the correct and pedantic gentleman who is always lying in wait for his own subject to turn up, and when it does turn up, promptly blows it to pieces by discharging at its head an 81-ton gun, loaded to the muzzle with facts and statistics. The discursive sportsman would have neatly put a bullet through the brain, and would have brought the game down unspoiled. The expert who has bottled up his knowledge for a year blows it to smithereens, and leaves nothing but a few scraps of fur or feather.—*The Spectator.*

— COBWIGGER: "I've fiddled away a week trying to get up a design for a home-made flower stand for use in the *Ladies' Friend.*"

Terwilligger: "That shouldn't be such a hard job."

Cobwigger: "But you don't understand. The idea is to get up something that can be made entirely by a woman; so, it musn't have any nails in it."—*Sunday Journal.*

SECOND EDITION.

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING,

WITH THIRTY-FIVE ILLUSTRATIONS.

48 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

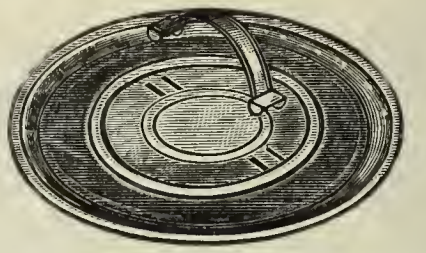
The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.

DAVID WILLIAMS,



PUBLISHER,

A Distinct Improvement!

——THE BUFFALO POT COVERS——

With Loose Attachable Handles.

With Loose Attachable Handles.

No woman likes a Pot Cover with a ring attached; she prefers a tin handle, but if the handles are soldered on the stock is an awkward one for the dealer and a dozen occupy as much room as a gross of the "Buffalo."

One dozen Covers and Handles packed in a neat pasteboard box, about an inch deep. Handles may be attached by any one instantly AS REQUIRED. Four slots, as shown in cut, are punched in cover, into which the tongues on the handles may be readily inserted and bent over on the under side, with the fingers, *securely* and *firmly* fastening the handle to the cover.

Make up an order from our catalogue (ask for one if you haven't one) and include a sample lot of these Covers.

SOLE MANUFACTURERS, Sidney Shepard & Co., Buffalo and Chicago.

Before. After.

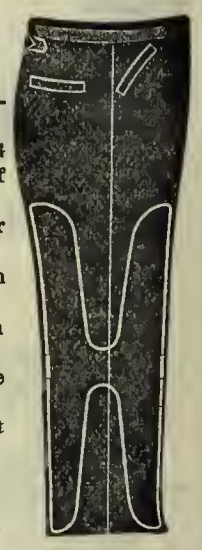
Covert Pants Stretcher.

THE Covert "Pants Stretcher" will restore the pantaloons to their original shape and length.

It removes all **WRINKLES and BAGGING AT THE KNEES,** giving them the appearance of having just left the tailor's hands.

It also holds the pants in a convenient position for brushing and cleaning.

The Stretcher cannot get out of order, and can be adjusted in the pants in a few seconds.



It being applied inside the pants, it obviates all objections prominent in other stretchers.

It is made of steel wire, and being in sections can be packed in a valise when traveling. Sold by the trade, or

Sample pair sent by mail to any address, free of postage, on receipt of $1.00.

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper in all Forms.

By JOHN FULLER, Sr.

327 Pages, 474 Illustrations, 7 x 10 inches, Cloth. Price, $3.00.

This work, prepared at great labor and expense, is reproduced from *The Metal Worker*, and forms an exhaustive treatise on the Coppersmiths' Art, being the only volume on that subject that has been published. It is beautifully illustrated with 474 pen and ink drawings, and is bound and printed in the best manner.

CONTENTS:

Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea-Kettles; Oval Tea-Kettles; Beer Mullers; Funnels; Coffee Pots; Sauce pans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set for Brazing Joint; Soft Soldering Large Joints; Taking Templates; Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills.

PURITAN WASH DOWN WATER CLOSET.

Best Closet Yet Produced for Either Public Places or Private Houses.

In presenting this Water Closet Apparatus to Architects and Plumbers and those interested in Sanitary Plumbing, will say that our aim has been to **Improve the Quality, Simplify the Construction and Reduce the Cost of Fitting in Place,** and we feel confident that we have done all this in the present Apparatus, and more too, **as it will discharge more matter, keep cleaner with less water and make less noise in the operation** than any Water Closet Apparatus now on the market.

The Closet is especially well adapted for Fire Proof Structures, as the Soil Pipe may be run above the floor, either behind or on the face of the finish. Another very good feature—stoppage can only take place in the bowl (where it can be reached from the top). Anything that passes this point will not lodge in the Soil Pipe.

These Closets are made of Vitreous Earthen Ware—that is, an absolutely non-absorbing material, warranted not to craze. Each Closet is stamped with a Bull's Head, our trade-mark.

The tank is provided with a cover finished to match. This cover deadens the noise, prevents fouling by dust and also prevents malicious persons from getting at or throwing anything into the tank.

The tank is worked either by hand action or seat action.

The distance from top of tank to finish of floor is 2 feet 6½ inches. From face of wall to front of Closet, 2 feet 1¾ inches. Depth of seal in Closet 2¾ inches.

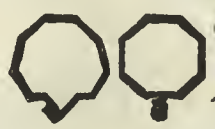
THE IRWIN & REBER

PATENT

EXPANDING WATER CONDUCTOR

MANUFACTURED BY THE

S. S. S. CONDUCTOR CO.,

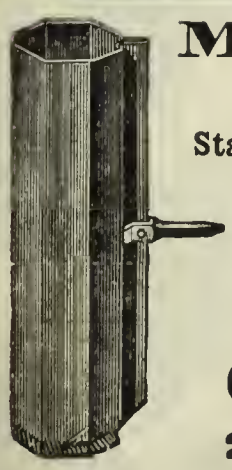


LIMITED

168 Lacock Street,

ALLEGHENY, PA.

THE STANDING SEAM allows of an easy and secure fastening, keeping the pipe far enough from the wall to make any overflow from the eave pipe or head run down the spout, and not the wall; and will open, in case of freezing, so as to prevent bursting, and still remain double-locked and water-tight.



Made in 6-foot lengths of a single sheet of SOFT STEEL.

Galvanized, Kalameined or Leaded.

The Irwin & Reber Expanding Water Conductor Pipe has been extensively used through the United States and Canada for the past ten years and has proved itself to be the best in the market. Send for Price-List.

BLINN'S

TIN, SHEET-IRON and COPPER-PLATE WORKER,

A New, Revised and Enlarged Edition, from New Type, with New Engravings.

One of the Most Popular Technical Books ever published in the United States.

A PRACTICAL WORKSHOP COMPANION

—FOR—

TIN, SHEET-IRON

—AND—

COPPER-PLATE WORKERS.

Containing rules for describing various kinds of Patterns used by Tin Sheet-Iron and Copper-Plate Workers. Practical Geometry. Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for every-day use in the workshop. By Leroy J. Blinn, Master Mechanic. A new, revised and enlarged edition, printed from new type, and with 170 newly engraved illustrations.

In one volume, 12mo, 296 pages, price $2.50, free of postage to any address in the world.

☞ It having been found necessary to make a new set of electrotype plates and new engravings of this most popular book—the old ones having been worn out by actual use—it was determined to have the book re-edited and to add to it, in the different departments, new, recent and necessary matter. All of the old illustrations of patterns have been retained, and new ones have been added. The portion treating of metallic alloys and solders has been entirely re-written, so as to have a more systematic arrangement, and to bring it abreast with the best modern practice in this interesting and important field. In all the other departments new matter has been added, every effort having been made to render the entire work, in the future, if possible, even more useful to the tin, sheet-iron and copper-plate worker than in the past.

ABSTRACT OF CONTENTS.

Rules for Describing Patterns; Practical Geometry; Mensuration of Surfaces; Mensuration of Solids, and Capacities of Bodies; Tables of Weights, &c.; Tables of the Circumference of Circles and of the Areas of Circles; Rules for Rendering the Tables Useful; Sizes of Tinware; Capacity of Cylinders, and various other Useful Tables and Information; Practical Receipts Varnishes, Lacquers, Cements, Metallic Alloys, Miscellaneous Receipts; Strength of Materials, with Tables Index.

DAVID WILLIAMS,

Bookseller and Publisher,

96-102 Reade St., - New York.

IS IT RIGHT?

Is it right to presume that the metal workers of America do not know the difference between common galvanized iron and good galvanized iron? We don't think so.

Would it be right to take advantage of that ignorance, even if it did exist? We don't think so.

Is it wise to conduct a business on that sort of a basis? We don't think so.

Taking advantage of other people's lack of expert knowledge is mighty poor business. Very few of us but have to take other people's words for things we are not wholly familiar with. Are we "fair game" for imposition because we depend on other folks' honesty? As a matter of fact, metal workers do know the difference between poor iron and good iron. They may be imposed upon once in a while because they believe in the dealer's honesty and do not watch him, but sooner or later they will find out the imposition, and then the dealer will be sure to lose their trade forever.

A dealer or manufacturer who sells inferior goods on the representation or with the understanding that they are first-class, is not a safe man to deal with. If he will sell a single sheet of iron that way, look out for him on a car load.

When we sell "Star Best Bloom," we guarantee it perfectly flat, full weight without variation, and absolutely true to gauge. It's the best grade of galvanized sheets we know how to procure. Doubtless, unscrupulous persons can occasionally sell inferior sheets at the price of the "Star." Doubtless they would make a little bigger profit on that one sale, but the big profits that result in lost trade are not so very profitable after all.

For a certainty of quality and an absolute guarantee of grades, address

MERCHANT & CO., Inc.,

Hicks' Guide
FOR
Builders,

Comprising an easy, practical system of Estimating Materials and Labor for Carpenters, Contractors and Builders.

A comprehensive guide to those engaged in the various branches of the building trades.

By I. P. HICKS.

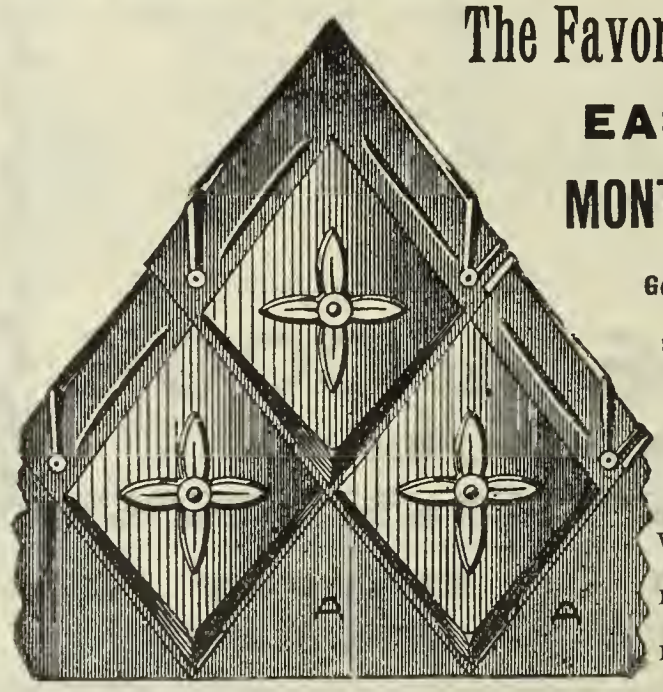
160 Pages, - 114 Illustrations.

Bound in Cloth, Price, - $1.00

This book presents to the trade, first, an easy, practical system of estimating materials, in concise form for reference. In the next place is given the average day's work of all kinds, and the average rates on which to figure in almost every detail of building construction.

Material and Labor, including Lumber, Carpentry Work Masonry, Plastering, Hardware, Painting, etc., are among the principal divisions. These in turn are illustrated and ably treated under numerous sub-divisions, showing step by step the entire work of estimating, contracting and building, together with the best and most practical methods of doing the work.

This is followed by a section given to the Geometrical Measurements of Roof Surfaces with numerous illustrations and examples. It embraces a new and simple system of framing curved roofs, also the simplest methods of roof framing of every description, with practical examples thoroughly illustrating nearly every conceivable form of roof and showing many points never before presented.



The volume also contains a chapter on Mitering Planceers, Moldings, etc., illustrating and describing how to make, in an easy, practical manner, many joints which are the source of no little trouble and annoyance on the part of the workman.

POCOCK'S ECCENTRIC

FORMING MACHINE.

We invite your attention to this new Former for Tinners' and Sheet-Metal Workers' Rolls, on which we claim rapidity of operation, superior construction and durability. The back roll is moved by eccentrics instead of screws, and can be changed instantly from the smallest circle to the passing of a straight sheet. It will flare metal easier and better than any other machine in use. You can get closer to front roll, therefore bend a smaller circle. For sale by all leading jobbers. Send for circular to

O. POCOCK, Mfr.

CINCINNATI, OHIO.

3-inch Rolls with Slip Rolls a specialty

The Tonquin Wood Mines.

The wood mines of Tonquin appear to constitute a curious source of wealth. The wood in these mines was originally a pine forest, which the earth swallowed in some cataclysm. Some of the trees are said to be a yard in diameter. They lie in a slanting direction and in sandy soils, which cover them to a depth of about 8 yards. As the top branches are well preserved, it is thought the geological convulsion which buried them cannot be of great antiquity. The wood furnished by these timber mines is imperishable, and the Chinese gladly buy it for the manufacture of coffins.—*Invention*

— NOW THAT IT IS OVER.—A lady who was shopping saw her husband examining pocketbooks at a showcase in another part of the store. When he had gone she approached the saleswoman in that department.

"Did he get the one I wanted?"

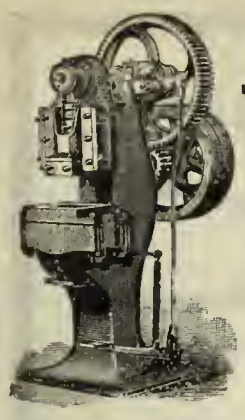
"Yes; the one with the silver horseshoe. I told him it was the best and would just suit."

"You're a jewel. I feared he would get something I didn't want. Thank you ever so much."

The husband had gone to his favorite drug store, where he asked:

"Has my wife been here?"

"Yes," said the clerk with a grin.



"Did she get a toothbrush or a box of cigars for my Christmas present?"

"She looked at cigars."

"Ha! I know the brand—$2 a hundred. Well, if she buys a box change them to my regular brand and I'll pay the difference. See?"

And the druggist saw.—*Detroit Free Press.*

Metal Workers' Machinery.

For several years past our efforts have been directed solely towards the production of a line of sheet metal working machinery that would at once prove economical, durable and peculiarly adapted for the purpose intended. In this we have been successful beyond our most sanguine expectations and therefore desire to announce to all workers of sheet metal that it would be to their interest to correspond with us. We have a good stock of various machines on hand and in course of completion. Address

— A Liberal Education.— A wealthy old farmer, as close as the bark on a tree, had sent his only son to a country academy to educate him.

"You shouldn't have sent him there," remonstrated a friend.

"What's the matter with the place?" asked the old man testily.

"It's too little and poor. You ought to send him to one of the big colleges and give him a liberal education."

"Liberal! Liberal!" squeaked the farmer excitedly. "Why, man, ain't it liberal enough when I allow him $25 a month for his schooling and living expenses?"—*Detroit Free Press.*

— Inexpensive.—"I promised to give my wife a surprise on Christmas."

"Indeed?"

"Yes. You see, it's all I can afford to give her."—*Chicago Record.*

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstrat on is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

PRICE, POST OR EXPRESS PAID, $5.

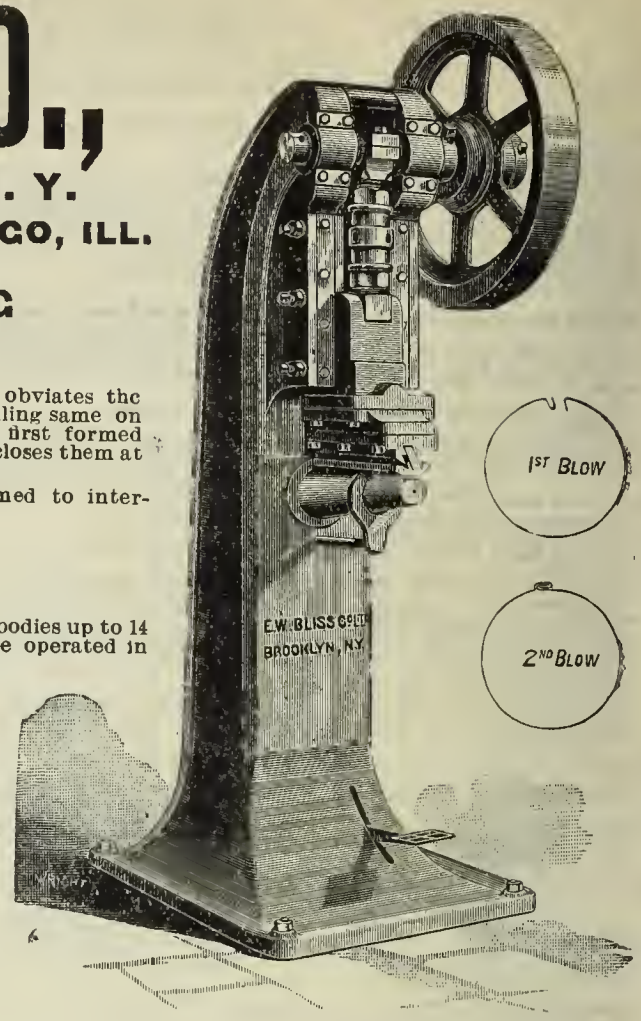
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

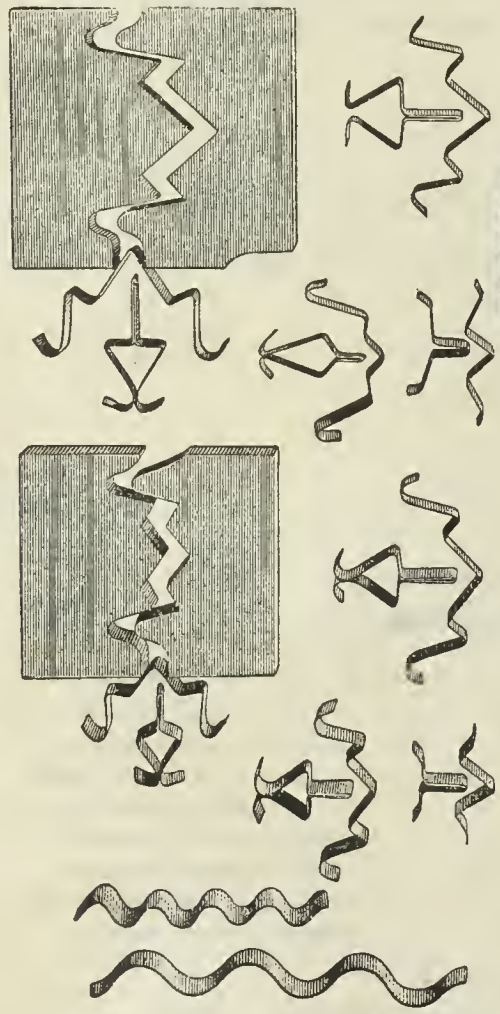
Second—That both edges are hooked at one blow.

Third—That the hook forming and closing are done in one handling.

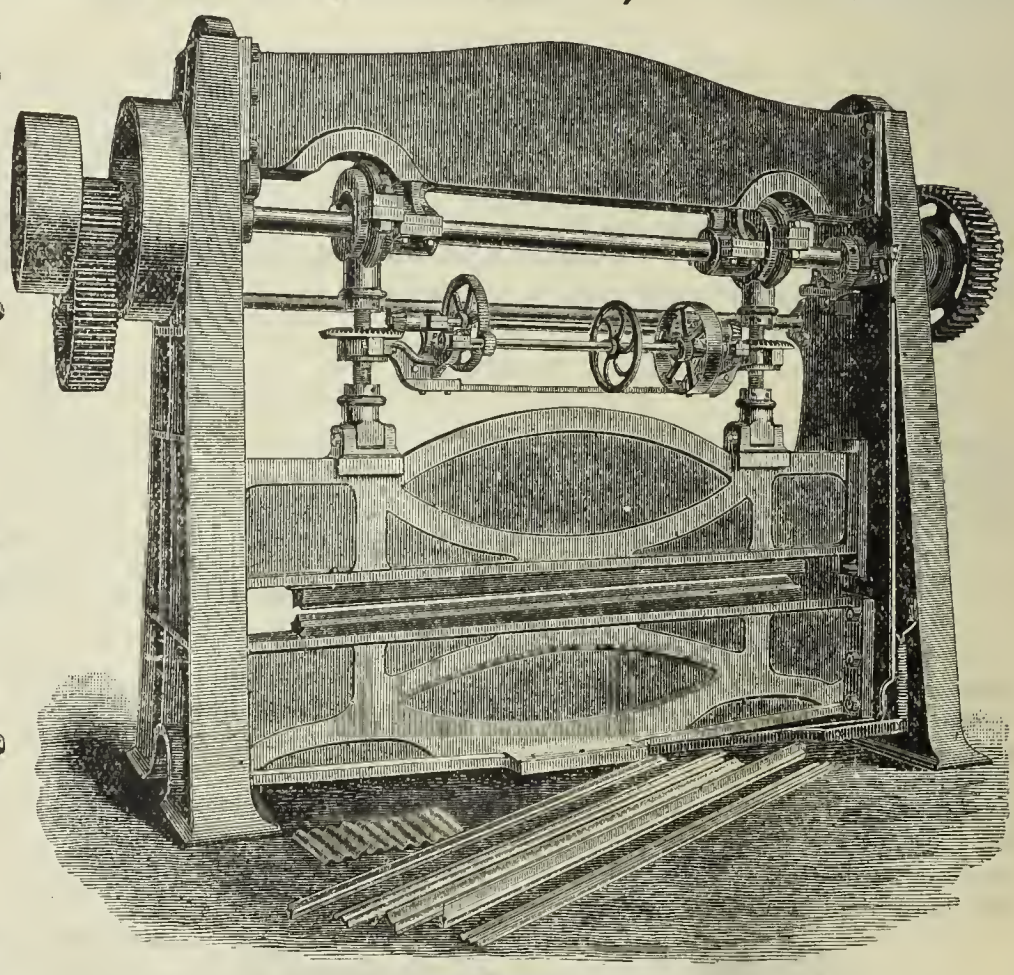
Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.

PRESSES, PUNCHES, SHEARS,



DROP HAMMERS,

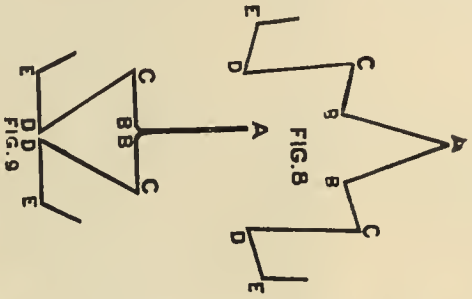


DIES, SPECIAL MACHINERY, &c.

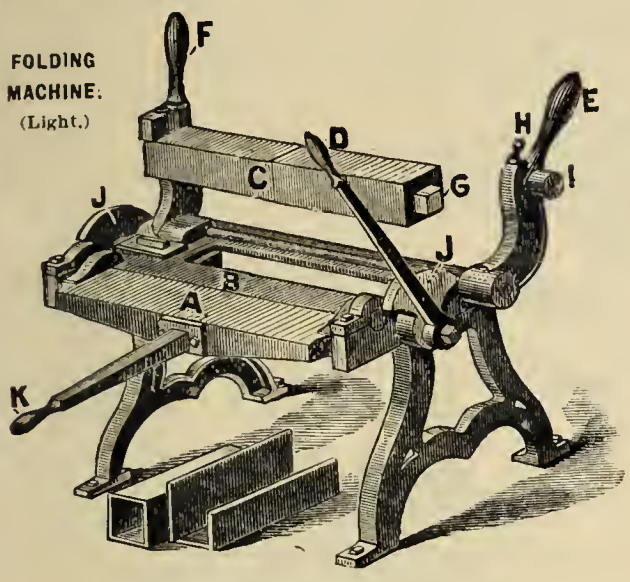
THE STILES & PARKER PRESS CO.

GEO. A. OHL & CO., 157, 159, 161 Oraton Street, NEWARK, N. J.

SOME SAMPLES OF WORK PRODUCED ON THESE MACHINES.



Improved Sheet Metal Power Press.

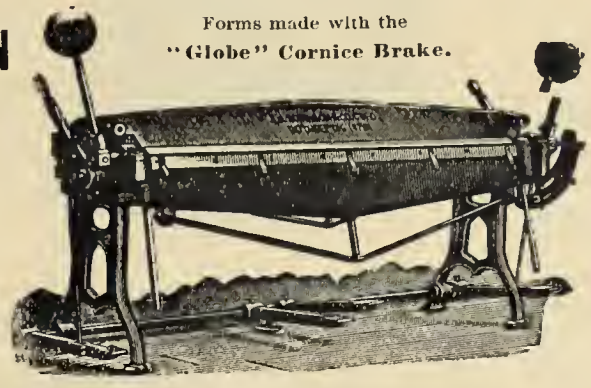


The above cut represents a ten foot power press weighing 20,000 pounds. This machine will make a skylight bar seven (7) bends at once of No. 24 iron, corrugate as heavy as No. 14 iron, also will press out mouldings of any shape that can be pressed between two dies. It is provided with a special mechanism for raising and lowering the hammer, with the die holder and die, to suit the different heights of the latter.

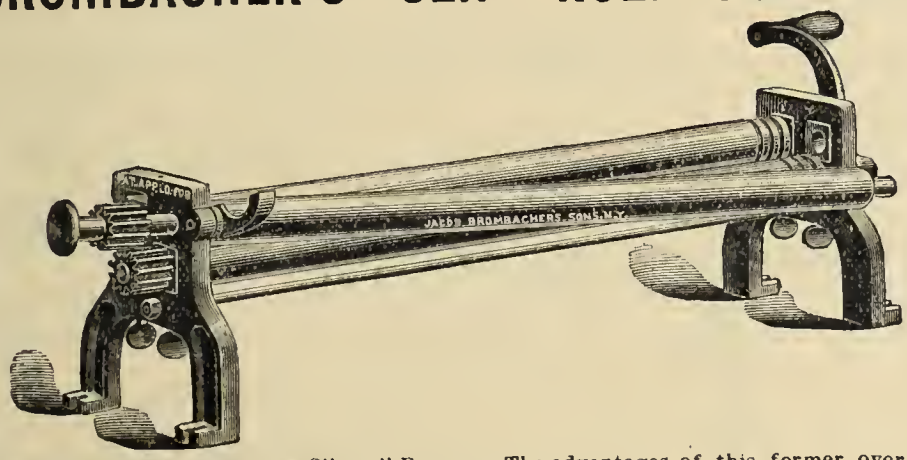
SHEET IRON, BRASS, ZINC, COPPER

working machinery of the newest and best designs is what we are and have been building for all kinds of shops, and for 37 years have been making and selling the "Globe" Cornice Brake. The first machine ever built for the purpose and which still stands at the head. If you will send us your address we will be glad to send you illustrations and description of what we make. If in the city, call and see us.

FOLDING MACHINE. (Light.)



J. M. ROBINSON & CO.,



CINCINNATI, OHIO.

This Advertisement Is Changed Weekly.

Forms made with the "Globe" Cornice Brake.

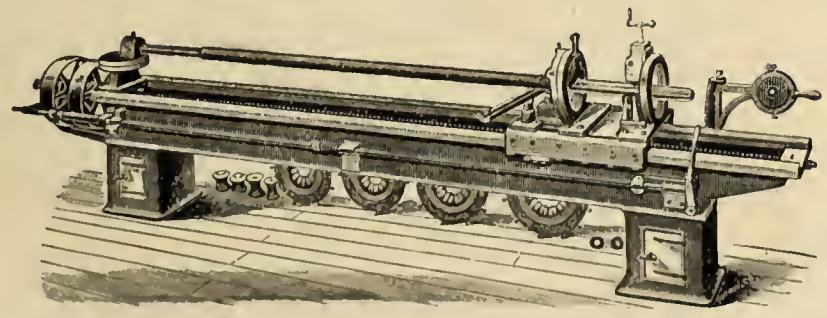
BROMBACHER'S SLIP ROLL FORMER.

Above cut represents our new Slip-roll Former. The advantages of this former over ordinary formers are

First, that the rollers are made of cold rolled steel rolls.

Second, it has cut gears with consequent smoothness of operation.

Third, the thumb screws are inserted from underneath, consequently the box carrying the rollers rests on the screws instead of the screws carrying the boxes and rollers; this obviates the possibility of breaking thumb screws.



Fourth, we do not have to split one frame in order to obtain the slip roll mechanism, and we therefore have all the rigidity of ordinary formers with all the convenience of slip-roll formers.

Above design makes the smoothest and quickest operating and stiffest Former on the market and they are sold at the price of ordinary Stove Pipe Formers.

JACOB BROMBACHER'S SONS - - No. 30 Cliff St., N. Y. City.

The Metal Worker Essays on House Heating by Steam, Hot Water and Hot Air.

WITH INTRODUCTION AND TABULAR COMPARISONS.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

How to Effectively and Economically Heat a Given Building

is a problem of the highest importance to the Architect, Builder and Owner. Shall steam, water or air be employed as a medium? What are the relative merits of the different systems? By what means can a comparison be instituted that will show their respective advantages?

The essays comprised in this volume are some of the results of a prize contest conducted by *The Metal Worker* some time since. They include the prize essays and selections from the best of the others. The foundation of all the essays is a house, the floor plans and elevations of which were the result of previous competitions conducted by *Carpentry and Building*. The elevations and the plans of this house were carefully printed on separate sheets adapted to receive at the contestants' hands lines indicating the position of heater, runs of pipes, location of radiators, etc., thus insuring a uniformity in presentation, and also holding the competitors to exactly the same conditions. The result, therefore, is a book in which are shown: First, different means of heating the same house, among which may be instituted various comparisons, and, second, several different interpretations of each of the several methods, among which also instructive comparisons may be instituted.

The work is not a mere theoretical consideration of principles and a statement of facts gained by inquiry in the trade; but, instead, a collection of essays by practical men, each showing how one man would go about heating the building in question, using the means with which he is best acquainted in practice. Features of the book which are not the least important among its numerous merits are the *lists of items and statement of cost* accompanying the different essays. Never before in the history of the heating trades has there been offered such a collection of information directly from the practice of those who are actively engaged in the heating business as is contained in this volume.

"The whole forms a valuable and instructive exposition of current practice in house heating."—*American Machinist.*

"Covers the ground very completely."—*Scientific American.*

"It will be found as complete a compendium as possible of existing information on this subject, amply illustrated by drawings."—*The Sanitary Era.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume. Price, $3.00.

The Best Galvanized Iron

ought not to require specification, for a first-rate job of difficult work can't be done without it, and a first rate job costs less with it than an honest attempt at a first-rate job without it.

Every first-rate metal-worker probably knows that Apollo is true to gauge and flat and bendable.

It is of some little account that the top and bottom sheets of a bundle are cushioned against the bands; and so are delivered almost without blemish, just as the top and bottom sheets protect the inside sheets from the bands in other makes.

Apollo Best Bloom is the trade-mark. It costs a little more in large quantities. This is the only reason that other galvanized iron is sold at all.

Important Notice!

All dealers in and users of vapor stoves are hereby warned that **THE STANDARD LIGHTING COMPANY,** of Cleveland, Ohio, and its duly authorized licensees have the exclusive right to make, use and sell vapor stoves employing the evaporating principle as embraced in the several patents granted Charles M. Hollingsworth, Rudolph Flick and Zebulon Davis relating to Process and Apparatus for Vaporizing Liquid Hydrocarbons and to Improvements in Vapor Stoves, and that all who purchase, use, sell or offer for sale stoves embracing said inventions, or any of them, made by others than The Standard Lighting Company, or its authorized licensees, are liable to prosecution, as well as the manufacturers of such stoves.

Having been lately informed that a Vapor Stove was being manufactured and offered for sale in Milwaukee, Wisconsin, which infringed the Hollingsworth patents No 420,797, No. 421,834 and No. 470,756, and the Flick patent No. 483,051, The Standard Lighting Company has commenced suit against the manufacturers for infringement of these patents and is now prosecuting that suit in the Circuit Court of the United States for the Eastern District of Wisconsin. It has also brought suit for infringement of these patents in other districts against dealers who are advertising such stoves or offering them for sale, and hereby notifies all who may either sell or offer for sale infringing stoves that they, as well as the manufacturers, will be held responsible therefor. For the purpose of protecting its licensees, as well as itself against all infringements, it will bring suit against others who sell, offer for sale or use such inventions, or vapor stoves containing them, without authority from it, so far as may be necessary to fully assert its exclusive rights in respect thereto; and it requests all who may know of any sale or offer for sale of infringing stoves to promptly notify it of the name and residence of the person or company selling them, or offering them for sale, in order that it may proceed to enjoin such infringers and to recover such damages as may accrue thereby.

The following are the only authorized manufacturers of these inventions, to wit.:

THE STANDARD LIGHTING COMPANY, CLEVELAND, OHIO,
THE DANGLER STOVE & MFG COMPANY, CLEVELAND, OHIO,
THE SCHNEIDER & TRENKAMP COMPANY, CLEVELAND, OHIO,
THE AURORA VAPOR STOVE COMPANY, CLEVELAND, OHIO,

DEALERS!

All Weak Points About Vapor Stoves

are not called to your attention by unscrupulous manufacturers or their salesmen. They often palm off imperfect and faulty stoves as perfect, and jolly you into the belief that you have struck a bargain.

But when summer comes and truth comes to light, as it invariably does in the vapor stove business, vexation and disappointment come with it. Vexation, because you have been duped, disappointment, on account of the loss of a season's profit.

Better handle a *good line* at a fair profit than a *poor* line at a *bargain* profit. There is no such thing as a "bargain," especially in the vapor stove business. *Proof*—Review the past???

Better buy from a responsible manufacturer or his legitimate jobber, especially of one whose integrity is unquestioned, and one whose knowledge of the vapor stove business secures you an honest deal and prevents the imposition of fakes or shoddy goods. *There are a few of us left.*

Better buy a good line to be successful. A *bad* stove is a very poor purchase at *any* price.

Better look for Protection.

Protection in order to be of service to you must begin at home. See that this point is not overlooked when casting about for a line for 1895

Better think this over.

The old adage reads, "Make Haste *Slowly*." This is a weighty proverb. The more so when you consider that the best versed manufacturers in the vapor stove industry are not offering any new inventions or innovations for the coming season.

Yours respectfully,

THE SCHNEIDER & TRENKAMP CO.,

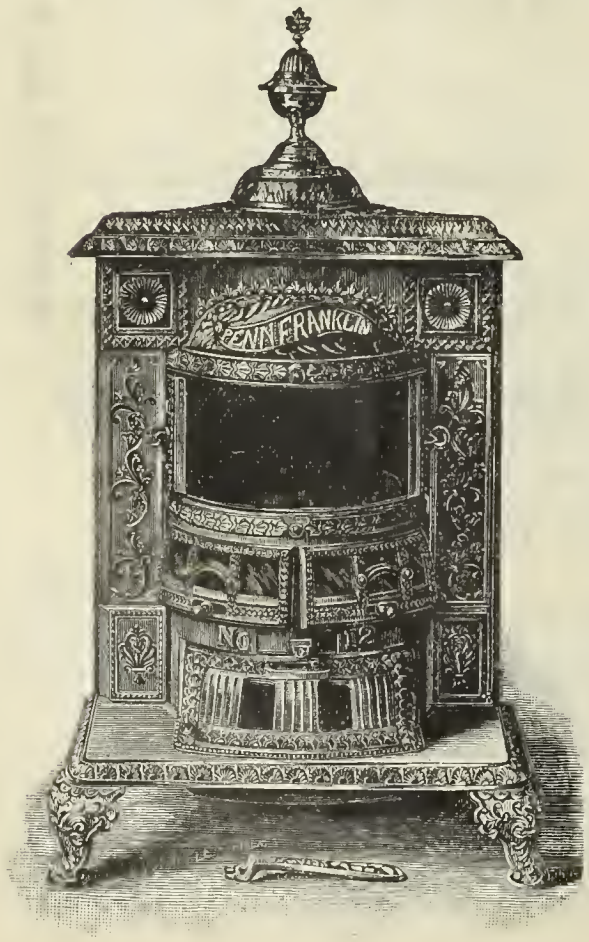
Guaranteed to be more economical, quicker in circulation and more durable than any heater in the market. Hundreds are in use and doing good service that were put in 25 years ago. Send for our illustrated catalogue, **"Health and Comfort in the Home Circle."**

Announcement of

An Important Meeting to take place at Offices of

The Ferrosteel Company,

Wade Building, Cleveland, Ohio,



Monday, February 4th, 1895—And following days.

This meeting is one of orders and inquiries for Ferrosteel Ranges that will be received. Also applications for agencies. Orders from traveling representatives, too. Will your order, inquiry or agency application be received with others? It's the style now to handle Ranges made of Ferrosteel. New sizes for 1895 Spring trade.

The

Penn Franklin

MT. PENN STOVES & RANGES READING PA.

Open Parlor Stove.

(Easily Converted into a Natural Gas Stove.)

Just close the mica doors and it can be operated like any round or square parlor stove. Close it up tight and there is no dust when raking. Burns any kind of fuel, and is a strong heater.

Easy to Sell,

Profitable to Handle.

☞ DROP US A POSTAL FOR PRICES.

Mt. Penn Stove Works,

READING, PA.

MT. PENN STOVES & RANGES READING PA.

IT has been said that in America TWO CLASSES of Stoves and Ranges are sold, viz.:

"GARLANDS"

—AND—

OTHERS.

At the very head and front of the "Others" stands our new line of

"MICHIGAN"

Stoves and Ranges, which are unquestionably the latest, handsomest and most artistically designed Stoves and Ranges to be found upon the market at anything like the price at which they are sold.

They are made under our own supervision; by same workmen and out of the same material from which "Garlands" are made, and this fact of itself should be sufficient to cause them to be preferred by discriminating merchants and consumers, as against all other brands, excepting the invincible line of "Garlands."

Electrical Cooking.

Electrical cooking is making considerable headway, and at present engages the fancy of fashionable London to a small extent, it being a "smart" thing to have an electrical dinner. But difficulties sometimes have to be overcome. The Institution of Electrical Engineers had their annual dinner the other day, says the Pittsburgh *Dispatch*, and felt that under the circumstances it must be electrically cooked. As luck would have it, the old-fashioned hotel they resorted to had not even the electric light, but a pair of wires were run temporarily. Then the chef was heard from. Opposition had been expected in that quarter, but he was simply furious and obdurate. He said he had two grandmothers dependent on him, and he would not run the risk of being killed to please anybody. At last the dinner committee induced him to go to one of the places where electric cookery was regularly used, and from angry skepticism he was soon converted and brought into a condition of superb enthusiasm. The dinner was cooked electrically, was an immense success, and if the old hotel does not soon add the electric light and electric cooking to its other admitted virtues it will not be the fault of the chef.

—THE FARMER'S MISTAKE.—"Jerusha," cried Farmer Haymow, "come here an' look at this young man on a bicycle. If he hain't got his hair as long as a woman's."

"Sho!" exclaimed Jerusha, when she had adjusted her spectacles. "That there's a gal in bloomers."

A PRETTY HINT.

She said to the youth as they stood at the door
While parting—the artful thing:
"Don't knock, if you please, as you d d before,
But next time come with a ring."

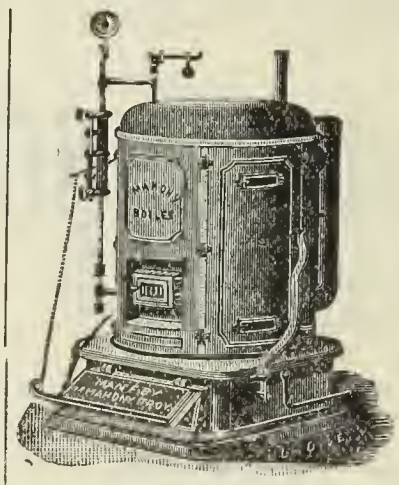
Song in the Household.



If any one has his choice about where he shall grow up let him stipulate for a family in which there are singers. It is a sore pity to grow up where there is no singing. In early days an American child's chances were better than now of being born into a reasonably large family; and though in some families all the members have music in them and in others none, of course the more there are the better the chances of song. Song is almost pure gain. It need not be of very high quality so long as it emanates naturally from inside of the singer and does him good. Its value as an appurtenance to domestic life lies not in its merit as a performance, but in its success as an expression of the feelings. Singing as a fine art is, of course, worth cultivating, but the species of song that we are now talking about is of the same sort as the singing of birds and of negroes. Ordinary, normal children ought to learn it by ear as they do language, and they should sing because they are happy, as the birds do. A child that grows up where there is no singing no more gets his rights than a young robin that is hatched out in an incubator. The robin is pretty sure to sing when he grows up and is turned loose in the sunshine, whether his ear got any early cultivation or not, for the habit has been strong in the robin family for generations. But if the child does not get his singing instincts developed by example while he is a child they may stay asleep permanently.—*Exchange.*

— No Misnomer.—Ignoramus: "How did England's great comic journal come to be called *Punch?*"

Wiseacre: "From the modus operandi of getting a joke into an Englishman's head."—*Exchange.*

SECOND EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth, Price, $1.00

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character. *American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome —*Plumbers' Trade Journal.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

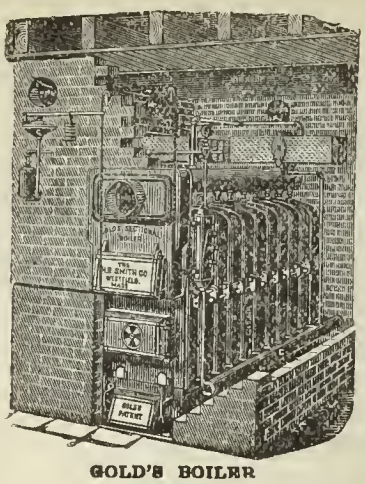
"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a handy reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."



407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

Sent post-paid on receipt of price by

About Colds.

The season of colds, at least the season accepted as such, being upon us, it is well to remind ourselves that the best authorities ascribe the prevalence of these distempers to bad indoor air rather than to severe outdoor air. "Cold air," says a writer in a recent magazine, "does not cause throat and lung diseases, but only bad air." The fact that there is a marked increase in these diseases during cold weather he fits to his theory by declaring that such disorders are produced, not by the cold air but by the indoor life that accompanies the season."

"An open fire in every living room in every house," says another enthusiast on the same subject of ventilation, "would do more to lower the death rate from respiratory diseases than any medication or other existing remedial agency." Barring this, he urges frequent airing of rooms constantly occupied, but also insists that the ventilation be done on principles of common sense. "Steam heated rooms," pursues this carping critic, "particularly in apartments, usually reach a temperature of 80. This I may say is a mild statement. Any persons living in such places endure this or greater heat until it becomes intolerable, and then throw windows open recklessly. The temperature is lowered too suddenly, a chill is sure to follow, and often serious mischief. Why not take the pains with our own lives that a florist does with his plants? The air in a greenhouse is regulated by a thermometer, and kept even and pure without a sudden chill of overheating. It is the high temperature and bad air of our houses that have made a race of catarrhal wheezers, and not at all, I believe, climatic conditions."

American Cities One Hundred Years Ago.

The extraordinary growth of the chief American cities during the past century is thus illustrated by the New York *Evening Post:* When Washington was inaugurated Philadelphia, then the metropolis of the country, had only about 42,000 people, New York but 33,000, Boston 18,000, Baltimore 13,000, and no other city anywhere near 10,000. Even after the lapse of half a century, during which New York had overtaken Philadelphia, so that in 1840 it had 312,000 inhabitants to the latter city's 258,000, Baltimore and New Orleans were the only other places with more than 100,000 people, and except Boston with 93,000, all of the few remaining cities fell short of 50,000. During the formative period of the new nation, therefore, all but the merest fraction of its citizens lived in places of small population, the local affairs of which were easily administered through town meetings or other such simple machinery.

— A LESSON IN SPELLING.—She (at the desk): "Dear, please tell me how to spell costume. I'm writing to mother about my lovely new gown."

He: "Well, are you ready?"

She: "Yes."

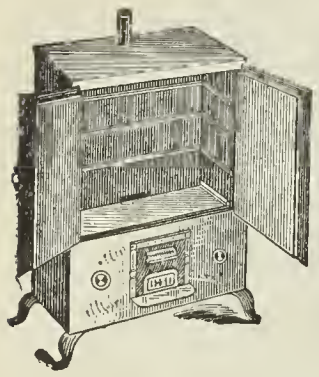
He: "C-o-s-t, cost."

She: "Yes."

He: "T o, to."

She: "Well?"

He: "M e, me—$65, as yet unpaid."



She: "You're a wretch."—*Frank Harrison's Magazine.*

— IN BETTER FORM.—Tom: "Why, Bessie, I could kiss you right under your mother's nose."

Bessie (with dignity): "I should very much prefer, sir, that you'd kiss me under my own nose."—*Scottish American.*

Snap Shots.

Civilization begins with soap.

The jumping off place is not always precipitous. It is sometimes a graceful and gradual incline.

The man who expects to lose rarely wins.

No useful man has to go back and rub out his unfortunate footprints.

A good way to help people is to refuse to speak unkindly of them.

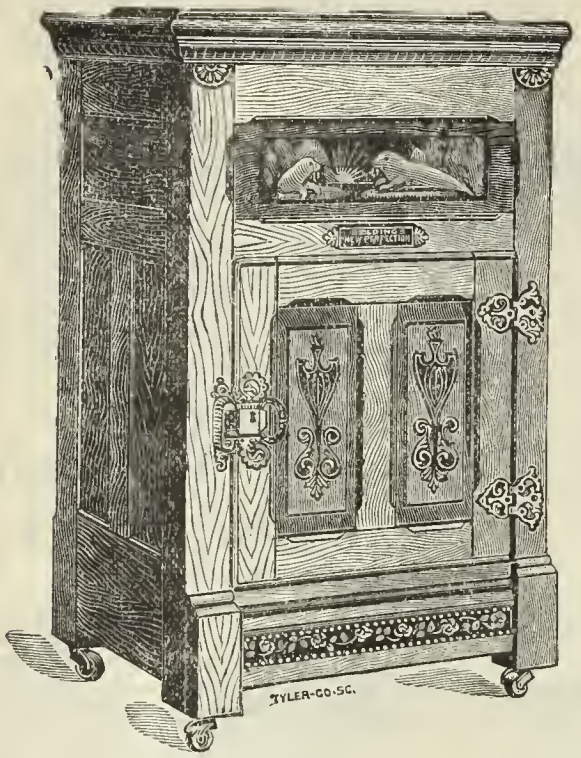
A really good talker is one who never talks too much.

Some people marry for life and others just for a honeymoon.

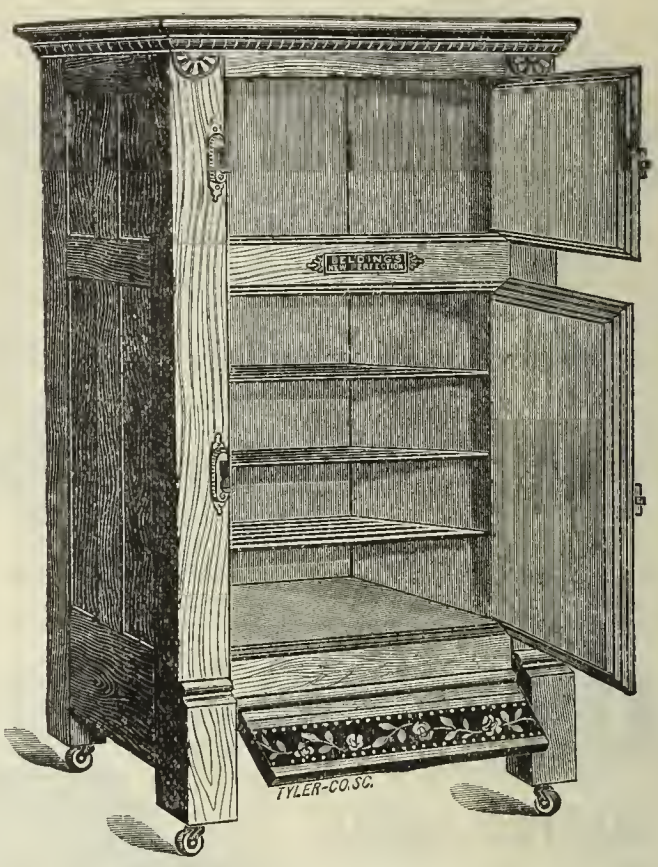
It is not what people know, but what they think they know that is so dangerous.

It is the guilty man who cannot afford to be suspected.

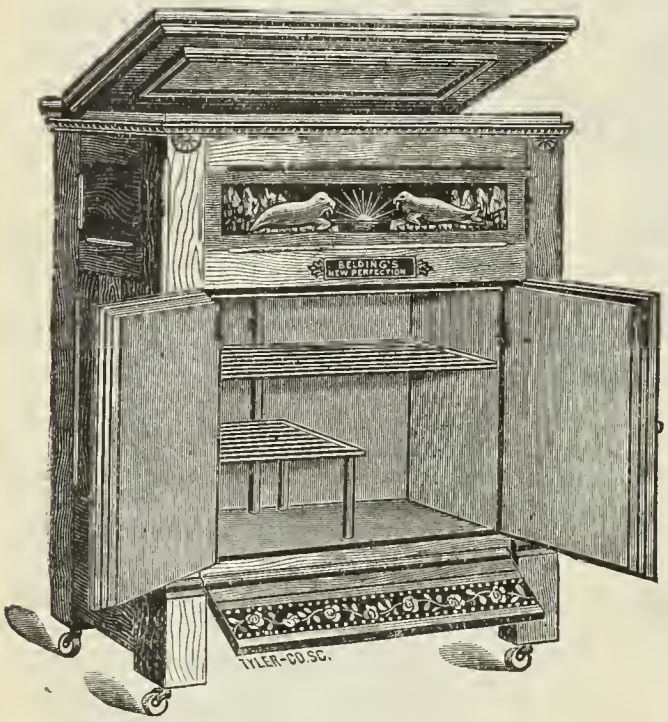
A little learning is dangerous, but downright ignorance is even more disastrous.



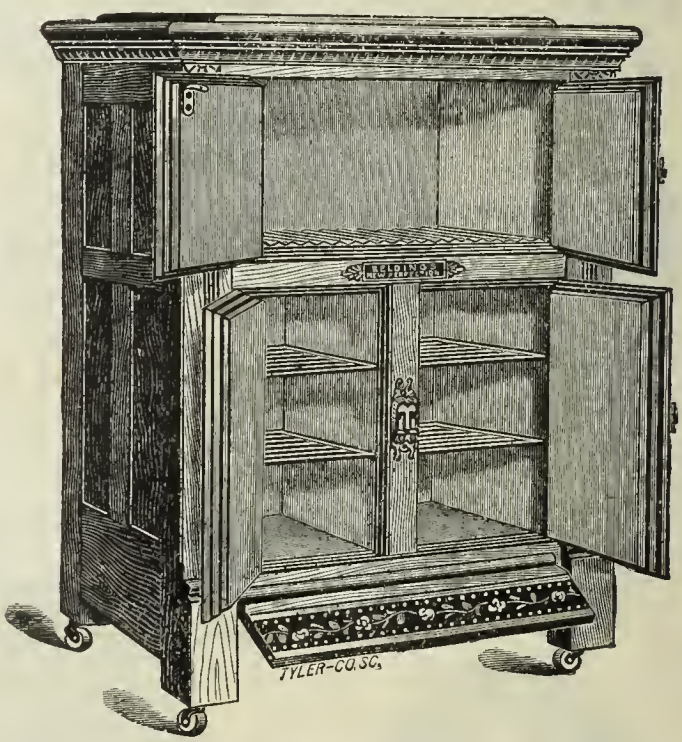
"Every dog has his day," and then wants somebody else's day.



The greatest slaves on earth are the mortals who always follow their own inclinations.—*Dallas Galveston News.*



Men Who Have Come to the Fore.



It is remarkable, observes the London *Iron and Coal Trades Review*, how very many of the greatest inventions and discoveries of modern times have been achieved by men who were not themselves trained to the business or profession in which they acquired distinction. Neither Bessemer nor Siemens was trained as a metallurgist, and yet they have been acclaimed as the most reactionary and epoch-making inventors in the whole history of the iron trade. Sir William Armstrong was not trained as an engineer, but as a solicitor, and yet he has revolutionized the art of gunnery and the manufacture of hydraulics. And so with many other modern instances. The so-called practical men are too often incapable of looking all round a subject, and are so wedded to usages and established rules as to look with serious disfavor upon any really novel idea, however meritorious.

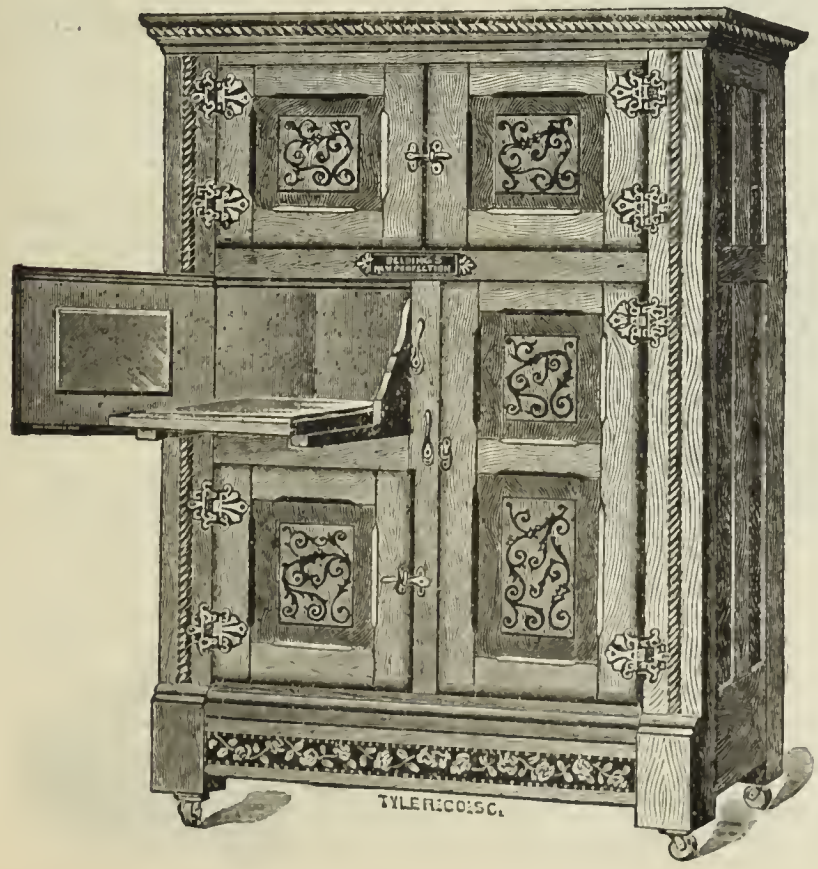
B—Bottom of Ice Compartment.
D—The **New Automatic Cold Air Damper.**
E—Door of Provision Chamber.

When the door of the Provision Chamber is opened the Cold Air Damper *immediatcly* closes the opening through which the cold air drops, thereby *instantly stopping the circulation* in the Refrigerator. Then, as the cold air in the Ice Compartment *cannot escape*, it is impossible for warm air to enter it through the flues in the sides of the Refrigerator; therefore, while the door of the Provision Chamber is open *no ice is wasted, no cold air escapes* and *no warm air enters* the Ice Compartment or *comes in contact with the ice.*



Thus it is clearly shown that this improvement is a *practical* one and makes our Refrigerators *consume less ice* than any that are now on the market.

OUR NEW DRIP CUP ATTACHMENT.

SOLID METAL ICE RACK.

No wood cleats to get water-soaked and tainted.

All refrigerators **hardwood, antique finish.** We carry large stocks at all of the following places:

Belding Manufacturing Company.

SEND FOR ILLUSTRATED CATALOGUE.

The Automatic Refrigerator

has more good points and does better work than any other and for that reason is a better seller. Our illustrated catalogue for 1895 tells all about the line. Its advantages are:

Perfect circulation.
Large condensing and purifying capacity.
It has no flues to cause it to smell bad.
The trap is inside where it cannot be misplaced or lost.
The drip pipe may be cleaned without disturbing anything in either chamber, and is entirely out of the way
It has nine walls to protect the ice and to maintain a uniform temperature in the cooling chamber.
It has woven wire provision shelves that are superior.
It has superior hardware.
It is more capacious and convenient.
Flavors of foods will not mix.
Last but not least, it's different, and will bring new customers and new trade.

We want the leading dealers to sell our goods and but one dealer in a place.
The goods are made of ash, and well finished.
We have two factories, one in the East and one in the West, and are able to take better care of your trade than if we had but one.

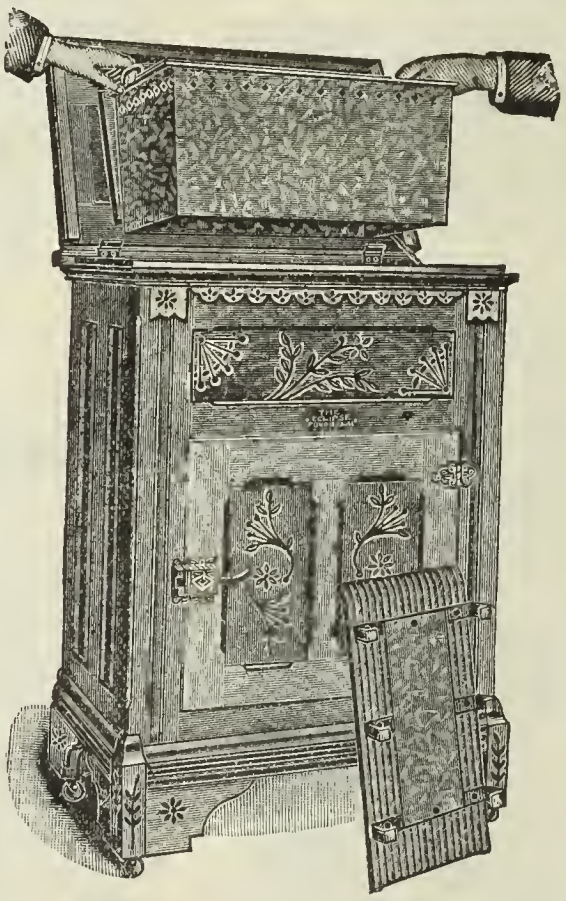
Making Life Easier for the Oppressed.



Here in America we have made history already. Some of it glorious, some of it ignoble; much of it made of the old stories told over again. We have learned some things that we did not expect to learn. We find that the social problems of Europe cannot be kept away from us by the quarantine of democracy. We find that the dead which the dead past cannot bury are thrown upon our shores. We find that weakness, misery and crime are still with us, and that wherever weakness is there is tyranny also. The essence of tyranny we have found lies not in the strength of the strong, but in the weakness of the weak. We find that in the free air of America there are still millions who can never be free—millions who can never be free under any government or under any laws, so long as they remain what they are. The remedy for oppression, then, is to bring in better men who cannot be oppressed. This is the remedy our fathers sought; we shall find no other. The problem of life is not to make life easier, but to make men stronger, so that no problem shall be beyond their solution. It will be a sad day for the republic when life is easy for ignorance, indolence and apathy.—*Exchange.*

ROYAL

WASH BOILER HANDLE.

PATENTED.

We call the trade's special attention to the Royal Handle, being the cheapest and the most durable handle in the market, fully protected by a number of letters patent, and all manufacturers using the handle report that their trade on wash boilers has largely increased. Over 100,000 handles sold in our local trade last year.

The advantages gained by using the Royal Handle can be readily seen, as it far excels the old fashioned tin or iron drop handles in beauty and strength, fits the hand perfectly and is always cold and adds greatly to the general appearance of boiler. Manufactured only by

HASLET, FLANAGEN & CO.,

Convention of Heating Engineers.

The first convention of the American Society of Heating and Ventilating Engineers, which was held this week at the house of the American Society of Mechanical Engineers, 12 West Thirty-first street, New York, was in every way a success. The attendance was large and representative. The papers submitted were of a high grade and secured close attention. The subjects for topical discussion were varied in scope, and the experiences related in discussing them were of an instructive character. The business of the society, as well as the discussion, was carried on with dignity, and a deep interest was manifested in establishing the society on a basis that would insure its permanency. A reading of the proceedings, which appear elsewhere, will enable an opinion to be formed as to the probability of success on this point. The society gives great promise of being very useful, and it has the best wishes of many friends for a long life.

Gumption.

How expressive is the word gumption, how evident in its meaning and yet how almost indefinable! Certainly it is skill, it is cleverness, it is sagacity, but it is more than one or all of these. Perhaps the skillful application of common-sense or the common-sense application of skill will define it. At all events it is assumed to be one of the characteristics of the true born Yankee and is an intangible something that turns failure into success. To a large degree a man of gumption is born, not made, but there is nevertheless ample opportunity to acquire this trait so desirable to the artisan. It can come only by perseverance and determination. It has nothing to do with a give-up-at-once spirit, which is displayed by so many individuals the moment they encounter an obstacle. One or two instances may serve to illustrate. A certain sheet iron worker was sent out to erect a system of galvanized iron piping. Running against a snag, he returned at once (some 50 miles) to see what he should do. His course was pointed out to him by the foreman in a somewhat emphatic manner and he returned to his work fully confident that he knew just what to do; but no sooner did he undertake it than his understanding deserted him, he could neither understandingly remember nor practically apply the instructions given and returned to the shop a second time. Very naturally he was kept at home (what was said to him need not be mentioned here). A substitute was sent, however, and upon his departure was asked what he proposed to do. His reply was that "he proposed to fix it," and fix it he did. He was by no means a better workman than the first, but he possessed a faculty which his predecessor absolutely lacked.

Horse Sense.

Again, a man was sent out upon the same kind of a job, and finding something to prevent his putting it up as originally designed, immediately telegraphed home that he could do nothing, as things were wrong. But he neither informed them wherein they were wrong, nor did he start for home and straighten things out, but actually waited until some one else had followed it up and settled the difficulty. Horse sense, as something akin to gumption, would appear to have been the missing faculty in this case. Doubtless no class of men has been called upon to exercise the most consummate gumption at shorter notice or under more trying circumstances than the old time millwrights. An entire mill might be shut down until their work was completed. The work must be done with the greatest haste, and yet it must be well done. All of a man's resources must be called upon, experience first and then ingenuity. And wonderful things have these men of gumption accomplished with the crudest of material and appliances. The mechanic of to-day may well admire their work and seek such a reputation for true gumption as they possessed.

Future Tinners.

A salesman who had served an apprenticeship as a plumber was very positive in his assertion that in the near future tinsmiths would be in greater demand than plumbers. His reason for the assertion was that innumerable boys were learning the plumbing and other trades and none were learning to be thorough, competent tinsmiths. He dilated on the fact that no small intelligence was required to be a tinsmith who could cut a pattern for any job that came to hand, and stated that in tin work a fine show of handicraft could be made. In the matter of variety of work presented, he thought no trade called for a greater amount of good judgment and widely adaptable characteristics. The tinsmith must be a good roofer, working to the best advantage in time and material, and through being a master of the art make roofs that would stay on without leaks or repairs. This same man must work sheet iron of all gauges with facility into stoves, furnaces and their many attendant requisites, besides knowing all about how to do a job that would give a strong heat and satisfaction. Without having any practice, as in old times, in making tinware, he must make neatly odd shaped vessels of a given capacity for special requirements, necessitating calculations that would puzzle a schoolmaster. It takes years to make a tinsmith, and it is always some new problem in head or hand work or policy that is being presented. Men who fill the bill thoroughly have acquired the wisdom and patience of a philosopher. The young man, however, who considers the trade of tinsmithing thoroughly will either be fascinated with its problems, or, disgusted with the demands that will be made upon mind and muscle, he will turn to some business where for the same or a smaller investment he can reap a greater remuneration.

Steps are being taken for the equipment of two short lines of the New York, New Haven & Hartford Railroad system with electric motors. The two lines are the Nantasket Beach and the Warren & Bristol, and if the experiment proves a success it is understood that electricity may largely supersede steam as the motive power on the railroad at no distant date. The current for these lines will be supplied by power houses —one located at Warren, which will run the cars from Providence to Fall River, including the Bristol branch, and another at Westport factory on the New Bedford line. Both open and closed cars will be used on this line, which is 35 miles in length, and when completed will be the most important and thoroughly equipped electric road in the country.

Appeals for aid are made on behalf of the settlers in North Dakota and Nebraska who are, in many places, entirely destitute, on account of the failure of their crops. Thousands in that section of the country are said to be starving and freezing for want of food, fuel and clothing.

THE LETTER BOX.

Brazing Cast Brass.

From S. E. B., *Chicago.*—I want to find out how to braze a cast brass boss on to a 2 inch wrought iron pipe. The boss is heavy brass and it is to receive a ½-inch cock. It is a job on a locomotive and has to stand steam. I have tried to do the work with spelter in the following way: I first filed the brass and iron pipe, then put the boss in place and bound it with a piece of heavy wire; then put in a forge with a clean fire, got up a heat and applied the spelter with borax, but it did not hold. The spelter did not melt, though I gave it pretty nearly a red heat. I thought it was hot enough, as spelter is supposed to melt at 467°. Is there more than one kind of spelter?

Answer.—We submitted this letter to John Fuller, Sr., author of the "Art of Coppersmithing," who writes as follows: The above inquiry, as is often the case, is very indefinite, and leaves us to guess where the difficulty is. There are so many mixtures called brass, and things called bosses, that we are from the nature of the case compelled to use our imagination and assume a form for the boss as well as its position

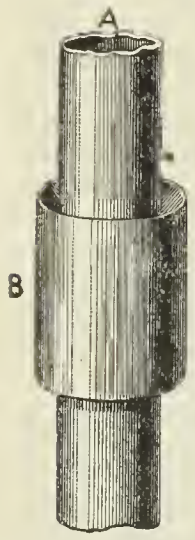

Fig. 1.—Pipe and Boss.

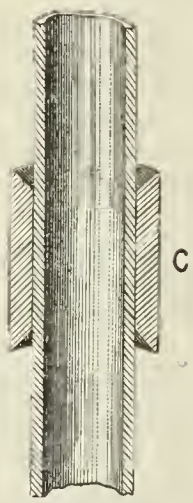

Fig. 2.—Sectional View.

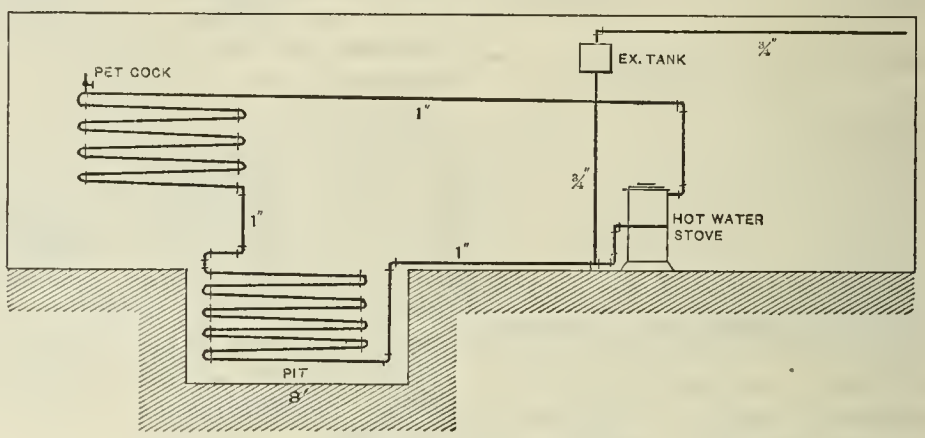
Brazing Cast Brass.



on the pipe. We will first consider the boss. To successfully braze or solder this boss the spelter should be made to suit it or the composition of the boss to suit the spelter. The ordinary solder is composed of 16 parts copper and 12 of zinc; therefore it is necessary the boss should have enough more copper in its composition to allow the solder to run free and easily on it without fear of fretting. If the boss is already supplied it should be tested by trying to run some of the spelter on it before it is placed in position for brazing. If it requires more heat than the boss will stand without fretting, then lower the solder until it will run readily. (Complete directions are given for doing this at page 248 in my work, "Art of Coppersmithing.") When the boss and solder have been tested and both proved satisfactory, the boss should then be prepared for the soldering. To illustrate: Let A, Fig. 1, represent a 2-inch iron pipe and B the boss 6 inches long and ⅛ inch thick. Now clean the pipe free from scale, and have the boss bored out so that it will fit the pipe tight, and have a channel or countersink made at each end of the boss ⅛ inch deep, as shown at C, Fig. 2, leaving the outer edge of the boss about ⅛ inch thick. Now stand the pipe securely in a convenient place near to the blast and proceed to set the fire pot as shown on pages 178 and 179 of the "Art of Coppersmithing" and proceed as there directed. If a boss or a brass elbow is to be placed on the end of the pipe, then the weight of the pipe should be taken off by slinging to a chain, as shown on page 181. It would seem from the correspondent's letter that he did not apply sufficient heat to run his spelter, or was afraid the boss would not bear the heat necessary, hence his failure. This can always be avoided by testing the quality of the things it is desired to solder with spelter, and then lowering the solder to suit when necessary, or by raising the quality of the brass to be operated on. If the above suggestions are acted on with ordinary ability success must follow. We shall be glad to hear from "S. E. B." again on this subject with details as to his success.

Evans Hot Air Furnace.

From J. J. B., *Philadelphia.*—In answer to "B. C.," New York, whose inquiry appears is *The Metal Worker*, January 5, the Evans hot air furnace is made by Evans & Co., Twelfth street, below Spring Garden street, Philadelphia.

Will It Circulate?

From F. D., *Salem, Mass.*—Will some reader of *The Metal Worker* please inform me if a hot water job as shown in the sketch will work, or if there is any better method of piping the job than that shown in the diagram? What I am trying to get is a coil under a printing press so as to keep the ink rollers warm, having the heater on the floor

Will it Circulate?

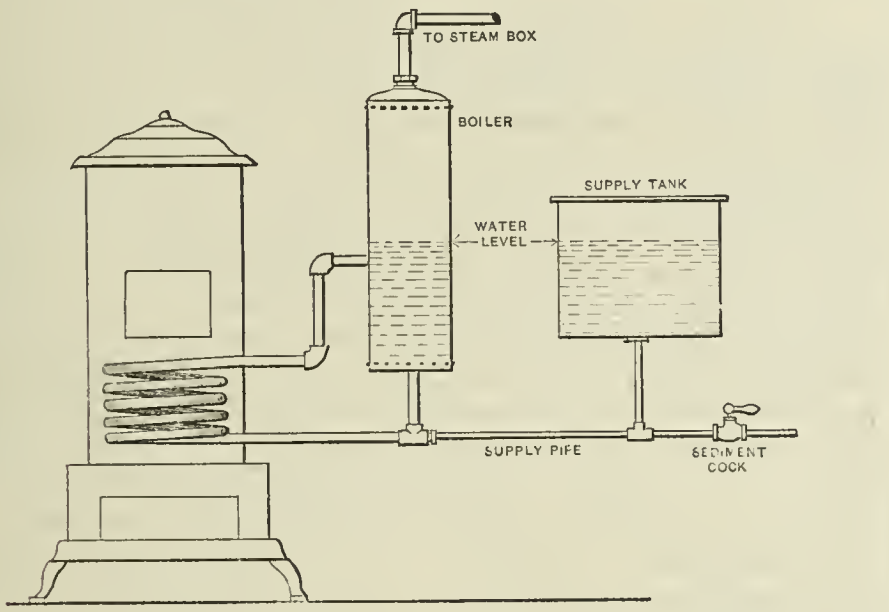
above the pit at one side. I wish the water to circulate through the coil in the pit after passing through the coil on the wall.

Flux for Soldering Zinc.

From C. M. W., *Spencerport, N. Y.*—In reply to "C. S. Z.," whose letter appeared in *The Metal Worker* of January 19, would say that for new zinc that is not corroded in the least tallow makes an excellent flux. It can be wiped off the work while warm and will not corrode the metal if left on. I hope this will help some of the readers of the Letter Box, from which I have often got assistance.

From A. L JAMESON, *Warren, Ohio.*—If "J. S. Z." of Richmond, Ind., whose inquiry appeared in *The Metal Worker* of January 19, desires, I will send him a sample of flux for soldering zinc and galvanized iron or for tinning black iron that will not discolor the work nor hurt either hands or clothing, for there is no acid in it.

Newark Parlor Stove.



From L. R., *West Troy.*—Will some one tell me who makes the Newark parlor stove No. 58? I have a catalogue of 8000 stoves made in the United States, but the one mentioned above is not in it There is a Newark stove made by G. H. Phillips & Co., but that is not the one.

Boat Builders' Steam Box.

From B. R. C., *Moriches, N. Y.*—I give herewith a diagram of an apparatus for the purpose of generating steam for a boat builders' box, and I would like to know if it is constructed on the right principle for the purpose. I argue

that it is, but it has failed to give satisfaction. The stove has a coil in it made of 20 feet of 1¼ inch pipe connected to the boiler. The boiler is about 8 inches in diameter snd 24 inches in hight, connected with the heating coil by 1¼-inch pipe. The water is taken to the boiler from a supply tank through a ¾-inch pipe. The cause for complaint is that the water in the supply tank boils, to which the owner objects. I have suggested that by placing a check valve in the ¾-inch supply it will stop the trouble and add to the efficiency of the apparatus in generating steam. To this he objects, as he thinks it would make but little difference in the steam generation and would prevent him from drawing water off through the sediment cock to prevent freezing. I shall be glad to receive some explanation as to how to overcome the trouble.

Answer.—There is much more surface in the heating coil than is needed to make steam in a boiler of the dimensions given. A check valve will relieve the trouble. By using a draw off cock on both sides of the check valve the apparatus can be drained. The arrangement of the plant seems to be correct. Comments from our correspondents are invited.

Boat Builders' Steam Box.

Railroads and Manufacturers.

The satisfactory adjustment of Western freight rates on stoves and agricultural implements, says *The Iron Age*, furnishes manufacturers in other lines an impressive example. Here is an instance in which determination and persistence have overcome the stubborn decision of not a few, but a large number, of railroad managers to advance freight rates. To secure the reconsideration of a step which had been formally ratified by one of the most important railroad associations of the country was a formidable undertaking. It was necessary to convince a majority of the railroad companies composing the association of the injustice of the proposed changes. Then a special meeting had to be called, at which the matter was again discussed, with the chances in favor of a change of heart after the representatives of the railroad companies got together. But the stove and implement manufacturers went to work with a will, and brought to their assistance allied business interests throughout the whole section affected by the proposed increase. Some of the manufacturers also laid aside their private business for the time and devoted their entire attention to the task of winning railroad managers to see the question from the standpoint of railroad patrons. The arduous service rendered by these individuals will perhaps not be appreciated by very many of their trade colleagues, but it was effective in securing final action. The benefit of this achievement is not merely confined to the settlement of the one question involved, but is likely to be felt in the future. The railroad companies will probably consider much more carefully any proposed readjustment of freight charges or changes of classification on stoves and agricultural implements.

Let the same untiring, unrelenting policy be pursued with regard to other grievances from which manufacturers are suffering at the hands of railroad companies. The assistance of friendly interests should be invoked in order to bring about as great pressure as possible, so that every day will be a burden to the railroad manager who persists in unjustly treating manufacturers. A special case in point is that of the freight rates on tin plate. The discrimination in favor of foreign tin plates should be the subject of continuous attack. The railroad companies participating in the establishment of a low through rate from Swansea to interior American points should be compelled to face the consideration of this question every day until they conclude to give American tin plate manufacturers fair treatment. An occasional newspaper article or an occasional letter to a railroad company will help to agitate the question, but it will not accomplish the purpose sought, and that is a complete reversal of the practice. Perhaps the damage which it is doing might have been checked long ago if a few of those immediately interested had dropped everything else for a time in order to handle this one matter effectively. Other grievances exist which should not be endured, and perhaps in every case it will be found that the only reason why they continue is because insufficient pressure has been brought to bear upon the officials who are responsible for them. The rate on coke from the Connellsville region to Chicago is a grievance of particularly long standing. Freight rates on other commodities have fallen, but this rate has stood immutable for years and years, as though fixed by some power higher than that of man. Although every foundryman in the Northwest is directly interested in the question of coke freight, it is left to the attention of the few pig iron producers. A reduction of 10 cents per ton is expected on February 1, it is true, but this is merely a sop which might have been made an important concession if a more vigorous policy had been inaugurated and followed up unremittingly by the consuming interests and allied trades. If the matter of freight rates were capable of exact adjustment on some definite or comprehensible system which was being rigidly followed, agitation of this character would not be needed. But as long as they are fixed arbitrarily, the patrons of the railroads must be more than watchful of their own interests. They should be persistently aggressive.

In a paper lately read before the British Royal Society, J. H. Gray and J. B. Henderson state that the density of a well annealed copper wire of 98 per cent. conductivity decreased about ⅛ per cent. if stretched 25 or 26 per cent. A lead wire also decreases about ⅛ per cent. just before breaking. A copper wire drawn through 12 holes of a draw plate increases in density more than 1 per cent. A manganese copper wire—10 per cent. of manganese—increases in density about 1 per cent. when drawn down to half its former diameter.

A Light and Heat Exhibition is to be opened in London next May. It will be located at Woodhouse Park, Shepherd's Bush, and all methods of heating and lighting will be illustrated. A historical gallery will furnish examples of lighting and heating from the earliest ages up to the present time.

The serious depreciation which has taken place of late in the values of agricultural products is reflected in an official statement recently published, which gives returns from 62 counties in Ohio showing that 1,000,000 acres of land changed hands last year, at a decrease of $3,000,000 from the preceding year's valuation, and that mortgage indebtedness in the same district increased 65 per cent.

The East St. Louis and St. Louis Bridge and Construction Company have been incorporated, with $500,000 capital, to build another bridge across the Mississippi River.

STEAM AND HOT WATER.

First Annual Convention of the American Society of Heating and Ventilating Engineers.

TUESDAY MORNING.

The first annual convention of the American Society of Heating and Ventilating Engineers was held in the auditorium of the Mechanical Engineers' building at 12 West Thirty-first street, New York, on January 22. At 11.15 President E. P. Bates called the meeting to order, the following members being present or arriving later:

Henry Adams, Washington, D. C.
Hugh J. Barron, New York.
Edward P. Bates, Syracuse, N. Y.
J. J. Blackmore, New York.
B. Harold Carpenter, Wilkes-Barre, Pa.
Geo. B. Cobb, New York.
Albert A. Cryer, New York.
A. C. Edgar, Philadelphia.
John A. Fish, Boston, Mass.
Frank W. Foster, Boston, Mass.
James A. Harding, Boston, Mass.
L. H. Hart, New York.
Alfred A. Hunting, Boston, Mass.
Stewart A. Jellett, Philadelphia.
Major H. E. Light, Saginaw, Mich.
W. M. Mackay, New York.
Wm. McMannis, New York.
Percival H. Seward, New York.
J. R. Wendover, New York.
J. J. Wilson, Baltimore.
W. A. Russell, New York.
Jos. M. Stoughton, New York.
Le Roy B. Sherman, New York.
W. B. Wilkinson, New York.
T. B. Cryer, New York.
Wm. H. Hill, New York.
Samuel Burns, New York.
C. C. Lincoln, New York.
W. J. Baldwin, New York.
N. P. Andrus, Brooklyn.
Chas. S. Onderdonk, Philadelphia.
Chas. S. Hopkins, Rochester, N. Y.
A. G. Paul, Boston.
A. J. Doty, New York.
Geo. T. Weymouth, Jr., Scranton, Pa.
W. H. Oakes.
Walter Pendleton, New York.
C. S. Graves, New York.
W. H. Clark, Lebanon, Pa.
D. M. Quay, Chicago.
B. F. Stangland, New York.
Thomas Barwich, New York.
Robert Munro, Chicago.
J. G. Dudley, New York.
E. R. Burroughs. Geneva, N. Y.
D. U. Cory, New York.
C. B. Boynton, New York.
W. H. Dewey, New York.
Fred. P. Smith, New York.
Wm. P. Skiffington, New York.
Thomas McNeill, New York.
Judson A. Goodrich, New York.
Albert A. Cary, New York.
N. A. Boynton, New York.
F. A. Herendeen, Geneva, N. Y.
T. Joy, New York.
C. F. Hauss, New York.
J. L. Wells, New York.

After disposing of the minutes, President Bates delivered the following address:

President's Address.

Gentlemen, Members of the American Society of Heating and Ventilating Engineers: I welcome you to this our first annual meeting. The purposes for which this society was formed are commendable in every respect. If we carry out the wise provisions which are named in the preamble to our constitution and by-laws we shall become public benefactors. We need to look backward but a very few years to find that our profession was unknown. The rapid strides of modern civilization have created many new professions, and ours among them. There is a wide field open before us, and it yet remains to be seen how well we will occupy it. The child is born, and it gives great promise of a grand future. I notice the following in the third clause of the preamble: "The maintenance of a high professional standard among heating and ventilating engineers." This is the proper basis on which to found this society. In order to carry out these sentiments we need to gather about us men devoted to the work, men of character and reasonably ambitious of success; men who will think, study and work until they see the fruition of their hopes. We need also in this infantile state to avoid adding to our number any who are not already engineers in our acceptation of the word. In a new society there is always a temptation to get numbers. This is commendable provided you confine your efforts to those fully qualified to associate themselves with you; those whose interests are identical with yours. I would prefer to work with a society that only counted ten members, and that ten fully banded together for a purpose, than to number a thousand and have divided interests. Many of us are still interested in contracting and mechanical construction. But as eligible members of this society, we can well afford to lay that aside for a day and look at heating and ventilating from a professional standpoint only. I now charge you as you love the cause in which you have so recently launched your bark to look well to your applications for membership, as the growth and perpetuity of this society rest upon this fully as much as on any other proposition. In regard to legislation which may in future be shaped by this society, I would say that the field is broad and but little occupied. The State of Massachusetts seems to have taken the initiative in enacting wise laws regulating the construction and ventilating of public buildings. Those laws are too voluminous to quote from at this time, but I would suggest that each member possess a copy of them, and become thoroughly familiar with their text. I believe that we should not cease our labors when public buildings are thoroughly warmed and ventilated, but our zeal for a good cause should eventually take us into every building which shall be constructed for any purpose. When any class of men have given continued study to a certain subject and have evolved a practical line of action it is not the time to sit idly by and fold their hands in self complacency, but this knowledge should be given to the world, forced on them against their will possibly in the beginning, but received with gratitude when the service is partially appreciated. There are cases where factories and workshops are fairly well ventilated, but in comparison they are rare. This is not always because the owner is unwilling to ventilate his building, but usually because he has not given the subject any attention. He is probably engrossed in the details of his business and would not know how to begin if he wished to ventilate his building. At this point a member of our society could render him an important service. There is another class of buildings which need our attention, but so far as I have been advised have been largely overlooked as of little consequence; I refer to the tenement houses in our large cities. You may hold that in the majority of cases the occupant does not desire any ventilation, but this does not affect the merits of the case. We should take the matter in hand and bring out a system which will be for the good of the masses. Every family has the right to have an abundance of good fresh air, even if they are not aware of their right. I hereby suggest that this be one of the first problems which we handle, and if possible we secure such legislation as will compel every person or corporation who shall in future erect a tenement house to connect each room to an individual ventilation shaft to be not less than 8 inches in diameter inside, round in form and preferably of glazed tile built in the walls of the building. You may think this a trifling matter, but I assure you that if we as members of this society accomplish this much within the next ten years and do not make any advance along any other line we shall have achieved a glorious return for our labors. We shall find, however, that we cannot labor for those of our race who live in the most humble homes without having our work redound to the benefit of the entire race. Ventilation comes next to godliness and must necessarily precede the manifestation of the latter. So I hold that in the next decade one of the human benefactors will be the men or the body of men who make it possible for their fellow men to be more cleanly in their surroundings. Our work, however, will not stay with any class; it will benefit all classes, and the amount of benefit received will be commensurate with the

labor expended upon it. In order to carry out all the objects of this society we shall need first the hearty co-operation of all its members; we shall need further a practical and intelligent devotion to the purposes for which we are organized. With these points carefully covered by each member, there is a work before us which never has been thoroughly done, but will be accomplished by the members of this society to their credit and the good of the race.

Report of Secretary.

Secretary L. H. Hart then read a report stating that there was a membership of 75, a number of new members to be voted on and a number of applications had been received. The preliminary work has been well done and the correspondence demonstrates that the success of the society is assured.

Report of Treasurer.

In the absence of the treasurer, J. A. Goodrich, who sent a letter of regret, his report was read by the secretary, showing that he had received $750, had paid out $250 and had a balance on hand of nearly $500.

Letters of Congratulation.

Letters of regret for their absence, wishing success to the society, and suggesting topics of interest were read by the secretary from Henry B. Prather, Buffalo, N. Y.; J. H. Kinealy, St. Louis; John Gormly, Philadelphia; James Mackay, Chicago; H. D. Crane, Cincinnati, Ohio; C. W. Light, Saginaw, Mich.; James R. Willett, D. M. Quay, Geo. D. Hoffman, Chicago, and John H. Petherick, Chattanooga, Tenn.

Board of Managers' Report.

In the absence of the chairman, Fred. P. Smith, a brief report was made by W. M. Mackay, who recounted the preliminary labors of the board for the meeting, and stated that a committee had been appointed to collect information, with a view to recommending legislation to provide proper laws to govern heating and ventilation.

The chairman of the council being absent no report was made.

Nominating Committee.

The president appointed a committee to nominate officers for the coming year, composed of Hugh J. Barron, James A. Harding, F. W. Foster, Albert A. Cryer and Henry Adams, with instructions to report at the next morning session.

The president then announced that the papers would be read, and in the absence of Prof. J. H. Kinealy of St. Louis the secretary read his paper on "Determining the Heating Power of Heating Systems," which is printed in full in another column.

J. J. Blackmore suggested that the premises of the paper were important, and in reference to steam met his views, but that the hot water standard was different from his experience. He urged that each member should endeavor, while the weather and season were propitious, to prove the value of the tables presented. In the absence of the writer of this paper it was laid over to be taken up at any time the members cared to call it up for further discussion. The next paper taken up was read by J. J. Wilson and was entitled, "A Short Talk On Hot Water Radiators." We reprint this in full elsewhere.

This paper was freely discussed by John A. Fish, James A. Harding, W. M. Mackay, Hugh Barron and Percival H Seward.

While it was yet under discussion a recess was called until 2.30 p.m.

TUESDAY AFTERNOON.

The president called the convention to order at 2.50 p.m., when telegrams were read from T. J. Waters, Chicago, and H. B. Prather, Buffalo, after which the members began the consideration of the topics for discussion. The secretary read the first topic: "In designing a system of heating and ventilation, shall we heat by radiation and supply only tempered air for ventilation, or shall we heat by air supplied for ventilation?"

C. S. Onderdonk favored simple systems

Stewart A. Jellett mentioned several plants using tempered air with advantage, but thought that combination systems were better. Mr. Jellett then read a paper prepared by him on "The Heating and Ventilating Engineer—A Commercial View," which is given in full elsewhere in this issue.

C. S. Onderdonk expressed himself as thoroughly in accord with this paper.

H. J. Barron asked how the evil could be cured, then stated that he doubted if it could be, and thought it would have to be endured.

Mr. Jellett stated that he had been asked by architects to furnish plans and specifications free of cost, who stated that they did not intend to pay. This had been met with refusal to work for nothing. Now his firm are superintending the construction of $400,000 worth of work, and their engineering department paid the best profits of their business and this branch of their business is growing. Major H. E. Light spoke earnestly on the advisability of plans being prepared by engineers of ability and suggested that contractors refuse to bid for large work when the plans were not prepared by engineers of known ability.

Chas. S. Hopkins expressed his opinion that this was a question of wages that would always be governed by the competition for the work.

J. J. Blackmore hoped that a preliminary step would be taken toward securing pay for engineers' services.

President Bates left the chair to speak on this topic. He held that service was just as much material to be paid for as the apparatus used. One point that had not been touched was the valuation put on the service by the engineer and it seemed that there was a fear that a charge for service would be opposed or the amount reduced. Fault could not be found with the owner if the engineer hesitated in his demand for a fee. If a plan was furnished that was clearly valuable and objection was made, no discouragement should be felt. He thought it probable that all could be benefited by more study of the art, then less difficulty would be experienced in collecting a fee for the service rendered. The evil, as it has been called, is susceptible of being cured, but is largely a work for individuals rather than collectively.

Another member stated that he believed that the stumbling block was largely the practice of boiler makers furnishing plans without limit.

The second topic for discussion was then taken up: "In a plenum system of heating and ventilation, which is the better for the air ducts, 'off and on' hot and tempered air dampers, or 'mixer' dampers?"

Major H. E. Light preferred the "off and on" system.

Charles S. Onderdonk stated his experience was against the "off and on" system.

J. J. Blackmore favored mixing damper.

The third topic was, on motion, deferred until after the reading of the paper by R. C. Carpenter. Topic No. 4 was then discussed: "The necessary size of risers for a given amount of heating surface for the different sizes of pipes and coils and for different classes and sizes of radiators."

H. J. Barron stated that the practice of making the return pipe one size smaller than the supply was common, but he could see no reason why it should not be one-half the diameter.

Stewart A. Jellett stated that good rules were known on this practice.

James A. Harding stated that W. J. Baldwin was present and he thought the members would be glad to hear from him. [Applause.]

Mr. Baldwin said he would hesitate to use a ¾ inch pipe to return from a 1½-inch pipe. As the pressure was reduced as the boiler became distant and friction increased, it was not best to reduce the return too much, and that the old rule was a good one.

At the request of some of the members, topic No. 6 was taken up: "The Probable Future of Electrical Heating."

Mr. Jellett hoped to learn something on this method of heating, as it was necessary that the society should know about this branch to be abreast of the times.

L. H. Hart then gave some information on this subject, but thought, owing to the cost, the heating engineer of today would have little call to prepare heating plants on this system. He sub-

mitted the following letter from W. S. Hadaway:

It is quite impossible to state in a few words the relation of electric heating to present methods, as the collateral advantages in every specific application are determining factors, as well as cost of the heat unit *per se*. In room heating on a large scale a close figure for use is that 1 electrical horse-power hour will heat (the heat being derived from electrical resistance solely) 7.5 square feet of common radiating surface 135° F. above room temperature. You can readily see how far 100,000 horse-power will go when used in this way. It is in combination with present low temperature methods of heat distribution that I look for the greater uses of electricity in heating. Of course in good practice 50 per cent. of the fuel energy is not too much to expect from steam heating on a large scale. We find in practice that few examples of high temperature heating show a fuel economy exceeding 50 per cent. But by combining the steam for low temperature distribution with electricity for the high temperature distribution, we can obtain figures high enough in fuel ecouomy to more than offset the increased fixed charges for plant, &c., and secure heat energy in a form readily localized, capable of close regulations and temperatures from maximum downward. I think this method can be illustrated by citing example of an apartment house. The house is equipped with boiler and electric plant for lighting. The rooms are warmed by steam and the water is heated by the same means. Electricity is used for lamps, arc or incandescent, ovens, broilers, fat fryers, sad irons, in short for every purpose excepting temperature, at which steam heat is usually applied. This means in practice two profits from the fuel. The electrical load described is obtained from live steam, and all the present live steam uses are replaced by exhaust. In other words, the electric plant is merely a high temperature factor, and its use leaves the energy of steam available for the present uses. It is needless to bring before you the advantages of such a system, as they are too apparent. The main feature to be brought out and emphasized is that the installation consists of two factors: First, a high temperature or heat potential system in which the electric plant is the means of generation and transmission, and a low temperature heat potential system, in which steam, either live or exhaust, is the means of generation and transmission, and in practice we cannot obtain the high potential system except from water powers and gas engines without the low potential system. I waut to extend the scope of the heating engineer to cover the electric plant. By so doing, a greater aggregate economy is secured and the conditions fulfilled add materially to the comfort and economy of this form of modern life. You can readily see that this is not flying into impossible schemes, but is a conservative view of heating problems. I have been greatly interested in the objects of your society, and as I expect to be in New York soon, I would be glad to attend your meetings. I think your people will find that the careful study of what I have outlined will aid materially in the work of heat distribution, even carrying it to the extent of district heat distribution for all purposes where heat is required, as we do water and gas and other forms of energy from central plants.

After the reading of this letter the convention adjourned.

WEDNESDAY MORNING.

The meeting having come to order at 10.30 a.m., President Bates stated he wished to correct a wrong impression that there had been a disposition to belittle the architects, which is wrong, for without the architect there would be no need of the engineer.

Letters were read by the secretary from R. C. Carpenter, W. F. Wolf and John Demarest regretting their inability to be present.

The report of the Nominating Committee was presented by James A. Harding, and after a brief discussion it was decided to hold the election at 12 o'clock.

Alfred A. Hunting of Boston read a paper entitled "Heating and Drying by the Use of Exhaust Steam and Live Steam Reduced to Low Pressure, Either Separately or in Combination." Chas. S. Onderdonk suggested that as this paper presented facts it gave little opportunity for discussion, but cited several proofs that failure to utilize exhaust steam was an expensive waste.

In the absence of Professor Carpenter his paper was read by Mr. Harding. It was entitled "Testing Steam Radiators."

Mr. Barron stated that his ideas differed with those of the paper and that he was in no doubt that some of his cherished views were wrong, but that the profession would probably pursue the old course, though the tests described showed such practice to be different from what would be best. Mr. Jellett remarked at some length on the efficiency of what are known as flue radiators, agreeing that the heating of air by contact was the most efficient means and radiators constructed to accomplish a close contact of the air were to be desired. J. J. Blackmore and J. A. Harding also made remarks on this paper.

Further discussion was deferred, as the time set for the election had arrived and the president announced A. G. Paul and D. M. Quay as tellers.

Mr. Bates stated circumstances existed that would prevent him from serving further as president and he hoped the members would cast their ballots for Chas. W. Newton.

The election resulted as follows:

President, Chas. W. Newton.

First vice-president, W. M. Mackay.

Second vice-president, Chas. S. Onderdonk.

Third vice-president, Stewart A. Jellett.

Secretary, L. H. Hart.

Treasurer, J. A. Goodrich.

Board of Managers: James A. Harding, B. F. Slangland, Geo. B. Cobb, U. G. Scollay and Wm. McMannis.

Council: R. C. Carpenter, E. P. Bates, Henry Adams, T. J. Water, A. A. Cryer.

An amendment to the constitution was offered by Mr. Jellett that hereafter the elections be held according to the plan followed by the American Society of Mechanical Engineers. After an invitation had been given by Mr. McMannis to visit the Department of Buildings and inspect the New York school heating system the meeting adjourned till 3 p.m.

WEDNESDAY AFTERNOON.

The meeting was called to order by Vice-President W. M. Mackay at 3.20 p. m.

D. M. Quay then spoke on the paper of Professor Carpenter, stating that specifications should go further than to give the amount of radiation required and the hight, shape and character should be specified. J. J. Wilson asked for the results of experience on the velocity with flue radiators, as compared with ordinary radiators. Mr. Jellett stated he had found that above 25 inches in hight flue radiators gained little, but up to this hight a velocity of two to two and one-half times what was possible with ordinary radiators could be secured. He had secured a temperature of 180° in the air current above the radiator and a temperature of 203° in the flue, which was not possible with a direct radiator.

In the absence of T. J. Waters the secretary read his paper, entitled "Heating and Ventilation of School Buildings," and B. F. Stangland read the paper by H. B. Prather, entitled "A Prison Heating and Ventilating Plant." Mr. Jellett described the prison at Allegheny, Pa., as having been erected previous to the prison mentioned in the paper. This plant has been very successful in operation, and in use since 1883 without repairs.

H. J. Barron then read his paper on "The Literature of Heating and Ventilating," after which he read a criticism on his paper by David M. Nesbit of London, Eng.

Discussion was resumed on the paper entitled "Determining the Heating Power of Heating Systems."

D. M. Quay remarked that while the specifications generally written required some result, that result was not sufficiently definite in its description to avoid difficulty in securing prompt settlement.

Mr. Jellett mentioned Schumann's rule for calculating the requirements of buildings for determining the final result, as being a good guide though not entirely satisfactory.

Fred. P. Smith remarked that it might seem odd for an engineer to mention that at times the heat unit is too closely adhered to, and that formula was not to be depended on at the expense of practical experience.

Mr. Barron doubted if the architect or his client could be satisfied in August by a test that the plant would be adequate in cold weather. Mr. Harding mentioned that he had one customer to agree to pay 6 per cent. interest on the cost of the plant till satisfied of its efficiency. W. J. Baldwin cited an experience where less indirect surface was required for a building than was needed in direct surface. Mr. Quay mentioned that respect must be paid to the data prepared by experts, even though cases were found where special judgment was necessary. Mr. Baldwin stated that data must be looked on as a beginning, which is necessary practice.

Mr. Smith suggested that the society should appoint a committee to secure a set of guarantees for both heating and ventilation to be authorized by the society.

Mr. Harding made a motion that a committee of three be appointed to confer with a committee from the Master Steam and Hot Water Fitters' Association on the formulation of a uniform specification and contract for the heating of buildings, which was carried. The committee appointed was Stewart A. Jellett, D. M. Quay and F. P. Smith.

James A. Harding mentioned that the by-laws provided for a semi-annual meeting at some place to be designated.

The American Society of Mechanical Engineers extended an invitation to the members to attend their monthly meeting on Wednesday evening, the occasion being the reading of a paper by Alphonse Fteley, chief engineer of the Water Works of New York, on "The Water Supply of New York."

The society tendered a vote of thanks for the invitation and then adjourned to meet at 10 a. m. Thursday morning.

THURSDAY MORNING.

The convention was called to order at 10.30 a.m. by Vice-President Mackay. Mr. Barron opened a discussion of the paper on "Heating and Ventilating of School Buildings," taking exception to many of its provisions, the location and character of the radiators, the speed of the air and the exhaust fan as used. B. Harold Carpenter agreed with the paper in the use of the blower. He did not think revolving air over night bad practice, even in the coal region where the fuel used could be secured at 90 cents per ton. Revolving the air over night could have few objections with a system that could change the air in the building in ten minutes. During the night vents were closed and the air was revolved by gravity from contact with direct radiators. The closets were provided with a vent shaft having a heater in it and no air direct from the system was used. The air from the halls and corridors, owing to pressure, found its way to the closets, kept the room warm and passed off through the vent shaft, preventing the closet air entering the building.

Mr. Harding spoke on the use of the exhaust fan in directing the outgoing air to the proper exit.

Mr. Jellett stated that he overcame vibrations from fans by drawing the air through fans and making connections by means of painted canvas. Air coming through the fan never brings water to freeze on the fan and stop its operation as he had known. He used an aspirating coil in the assembly chamber of the ventilating ducts in the attic, as he had known the weight of the air in a cold attic to stop ventilation. He did not depend on louvers for the escape of air, as they were affected by wind pressure, but used specially constructed ventilators which prevented down draft. He also mentioned the use of mica dampers in connection with louvers and vent shafts to prevent down currents.

Mr. Baldwin called attention to the unavoidable placing of ventilating flues in outside walls.

The secretary stated that Thomas McNeill, an old steam engineer, was present and had invited the members to attend one of his lectures at the New York Trade School on Friday afternoon.

Mr. Baldwin, who designed the system of ventilating the subways of New York, gave a brief description of it, and invited the members to inspect the system.

Mr. Jellett asked to have the Specification Committee increased to five, and the Chair appointed James A. Harding and E. P. Bates.

George B. Cobb moved that a vote of thanks be tendered to their past officers for their labors in perfecting its formation, which was carried.

After some discussion, a motion dispensing with the semi-annual meeting for 1895 was then carried.

The secretary read the contract with the American Society of Mechanical Engineers for the use of their house, which was considered very generous.

Topic No. 7 was taken up and Mr. Jellett described a method of avoiding the use of air valves, and mentioned systems with 428 radiators and others of 44,000 feet of radiation working successfully.

J. L. Wells considered that the air valve could be dispensed with only at some risk.

Mr. Quay described successful working plants in Chicago.

The meeting then adjourned.

THURSDAY AFTERNOON.

The convention was called to order by Vice-President Mackay at 3 p.m. The secretary read a telegram from Charles W. Newton resigning the office of president, making necessary a new election, which resulted in the choice of Stewart A. Jellett for president. Mr. Jellett expressed his interest in the society, and said his endeavors should be for the welfare of the society, of engineering and the public. The advance of Mr. Jellett left vacant the office of third vice-president, which was filled by the election of D. M. Quay.

Mr. Harding moved in compliance with the law that the secretary be instructed to cast a ballot for all of the officers of the society, which was done.

New Members.

The council announced the election of W. Harry Dewey and Norman S. Kellogg to full membership; Geo. T. Weymouth, Jr., as a junior member, and Samuel D. Tompkins, Thomas Thompson and A. G. Paul as associate members.

Topic No. 12 on "Value of Standing Committee of the Society on Tests and Standards" being next discussed, D. M. Quay moved that a committee be appointed to make and supervise tests and standards, which was carried, and the following committee was appointed: Major H. E. Light, A. A. Hunting and E. P. Bates.

H. J. Barron moved that a committee be appointed to establish a clearly defined minimum standard of heating and ventilation for all classes of buildings, which was carried, and the following committee was appointed: H. J. Barron, Wm. McMannis and Prof. J. H. Kinealy.

On Mr. Barron's motion that a committee of five be appointed to frame a law to provide legislation compelling the ventilation of all public buildings in accordance with the standard of this society the chair selected the following: W. M. Mackay, James A. Harding, L. H. Prentice, H. D. Crane and B. Harold Carpenter.

Discussion of A. A. Hunting's paper on "Heating by Live and Exhaust Steam" was taken up and remarks made by Messrs. Barron, Quay and Harding.

J. L. Wells, chairman of the Executive Committee of the Master Steam and Hot Water Fitters' Association of the United States, spoke on the preparation of a uniform contract, and stated that one had been drawn up which would be sent to all members if they desired. This contract is not considered to be final in form, but open to improvement with a view to provide for a reasonable safety to the heating contractor for his money. It also provides for the payment for plans and specifications and makes provision for insurance and the payment for extra work.

Topical discussion on iron and steel pipe being taken up, D. M. Quay stated that steel pipe as found was often harder on one side, making it difficult to cut, and also to thread, as the threads were deeper on one side than on the other. Steel pipe was also thinner, so that the threading weakens it more relatively. He also stated that pipe up to 2-inch is now made with a butt weld. Mr. Light found it difficult to make up the joints in steel pipe. Mr. Barron said his men objected to using steel pipe. Above 6 inches in size, however, steel pipe is not objectionable, but in small sizes it had been said it increased the labor of cutting and threading 20 per cent. Mr. Carpenter asked for information in reference to durability of these pipes exposed to electrical currents. Mr. Barron related the experience of a contractor who used cast iron pipe with screw joints in the ground with good results.

In discussing topic No. 20 the general impression was that mushroom registers introduced air at the point of contamination and then circulated it, which was objectionable.

The convention adjourned at 7 p.m., to meet again next year in New York at the call of the Board of Managers.

A. B. Wheeler, formerly with the Detroit Heating & Lighting Company,

and Windsor Heater Company, is now with the Hoffman Russell Company, 82 Lake street, Chicago.

HEATING NOTES.

THE NIAGARA RADIATOR COMPANY, Buffalo, N. Y., have placed Walter Pendleton in charge of their New York office, at 89 Centre street. Mr. Pendleton has an attractive display of radiators in his showroom.

W. A. RUSSELL has resigned the management of the business of the Niagara Radiator Company, at 89 Centre street, New York, in order to give his whole attention to the valves and numerous specialties of the Detroit Lubricator Company, Detroit, which under his management have become well known to the heating trades. Mr. Russell is now furnishing an office very handsomely in the same building and will be pleased to receive calls from those in the heating trades.

A MEETING of the stockholders of the Kentucky Heating Company was held last week at Louisville, Ky., and resulted in the re-election of the old Board of Directors and officers. Donald McDonald was elected president, R. T. Durrett vice-president, Chas. F. Johnson second vice-president, W. T. Durrett engineer, and Thomas W. Kennedy secretary. The members of the Board of Directors are R. T. Durrett, J. H. Lindenberger, P. Meguiar, Charles F. Johnson. W. H. Dillingham, Nicholas Finzer, J. G. McCullough, W. T. Durrett and Donald McDonald.

G. SHREWSBURY of the Calda Works, Station Road, Camberwell, London, S. E., England, is putting on the market a new conservatory boiler to use gas as a fuel.

THE LARGE CALENDAR which the Smith & Winchester Company of Boston, Mass., are sending to their friends in the trade is a conspicuous record of the days. The whole publication measures some 14 x 25 inches and half of that space is given up to the 12 monthly sheets. The design of the upper card includes a picture of the Winchester boiler, and besides the name of the firm, calls attention to their business in steam, gas, water and plumbers' supplies. The word "Everything" spelled out in pipe fittings indicates the range of the company's goods. Special articles are noted on each separate sheet. Pumps, wind engines, heating boilers, &c., are some of the articles enumerated.

THE C. R. MERES MANUFACTURING COMPANY of Norwalk, Ohio, have been incorporated, with a capital stock of of $10,000. The incorporators are Calvin Whitney, S. W. Owen, C. P. Wickham, J. S White and F. H. Jones. The company will manufacture the hot water furnace recently patented by C. R. Meres.

THE JOHN DAVIS COMPANY, 253 255 Kinzie street, Chicago, are to install a steam heating and power plant in the building of George G. Newberry, Wabash avenue and Eldredge court.

THE SAMUEL I. POPE COMPANY, 237 Fifth avenue, Chicago, are to furnish for the water works at Woodstock, Ill., engine house and stack, tubular boiler, artesian well, pump, fire pump, boiler pump and heaters and four miles of water pipes. The amount of contract is $26,000.

Determining Heating Power of Heating Systems.*

BY J. H. KINEALY, ST. LOUIS, MO.

It has always seemed to me that the requirement in a contract for a heating system that makes the contractor wait for his money until the system can be tested in zero weather, in order to determine its heating power, is a bad one in every way.

If the plans and specifications have been drawn up by a consulting engineer not in the employment of the contractor, the engineer is responsible for the proper working of the system, and the contractor, in such a case, is only responsible for the work being done in accordance with the plans and specifications.

Where there are no plans and specifications upon which contractors are asked to bid, but each contractor is expected, or asked, to furnish his own plans from which to work, it is but reasonable that the owner should be given either a complete set of plans and specifications that he may submit to a consulting engineer for advice, or a guarantee of some kind as to the heating power of the plant.

Very few of the small heating systems put in dwellings have any very elaborate plans drawn for them, and many large plants are put in without any specifications at all. This of course is the natural result of the desire on the part of the owner to avoid the cost of plans and specifications. He, therefore, goes to a firm of contracting heating engineers and tells them he wants his building heated by steam or hot water, as the case may be. The contractors send a man to look at the building or the plans of the building, and to make a rough sketch of what will be required; this sketch may or may not be somewhat elaborated in the office, but, whether it is or not, it will serve as the basis of the bid for doing the work. The contractor knows the owner does not care for any elaborate plans and specifications, and, therefore, as he should from a business point of view, he spends as little money upon them as possible, and makes only such drawings as are absolutely necessary to carry out the work. Another reason why the contractor does not get up more elaborate drawings than are absolutely necessary for himself is that he is not sure the owner will want the work done after the bid is made. It may be the owner finds he cannot afford to have the work done at all, or that he has received a cheaper bid from some other firm.

The owner desires only that the building shall be heated during all kinds of weather, and that the cost of the plant shall be as small as possible; and as custom in most parts of the country has decided that a heating system of a building shall be considered as adequate if it will keep the temperature of the air in the building at 70° F. during zero weather, he asks the contractor to guarantee the plant to do this.

The contractor guarantees that the plant he proposes to put in the building will keep the temperature inside at 70° F. when it is zero degrees F. outside; puts in the plant, and then, hardest part of all, waits until zero weather to test the plant and get his money.

In order to avoid the waiting for zero weather on the part of the contractor, I desire to propose a scheme for determining the heating power of heating systems during weather when the temperature is above zero.

It is assumed, as the basis of the scheme, that the heat lost through the walls and windows of a building during an hour is directly proportional to the difference between the temperature of the air inside the building and that of the air outside; also, that the heat given to the building in an hour is directly proportional to the difference between the temperature of steam or hot water in the radiators and that of the air inside the building.

The total amount of heat lost by the building per hour is given by the equation

$$H_1 = a\,(t_1 - t_2).$$

a is the total heat lost per hour per degree difference in temperature.

t_1 is the temperature of the air inside of the building.

t_2 is the temperature of the air outside of the building.

Also, the total amount of heat received by the building per hour is obtained from the equation

$$H_2 = b\,(t_3 - t_1).$$

b is the total heat received per hour per degree difference of temperature.

t_3 is the temperature of the steam or hot water in the radiators.

t_1 is, as before, the temperature of the air inside of the building.

t_3 may be very little greater than the temperature of the steam in the boiler, or it may be much greater, depending upon the length of the pipes, and upon the way in which they are protected.

Now, after the system is in the building, it is evident that the heat lost per hour must be equal to what is received, if the temperature inside remains constant, and, therefore,

$$H_1 = H_2, \text{ or}$$
$$a\,(t_1 - t_2) = b\,(t_3 - t_1).$$

From this we have,

$$\frac{t_3 - t_1}{t_1 - t_2} = \frac{a}{b}$$

Since the building cannot change, a cannot change; and since the heating system is supposed to be always the same after it is put into a building, b cannot change. Therefore, for the same heating system in a building, we have this proposition, which always holds good whatever may be the value of t_1, t_2, or t_3:

The result obtained by dividing the difference between the temperature of the steam or hot water in the radiators and the temperature of the air inside the building, by the difference of temperatures of the inside and outside air, always the same quantity for the same building and heating system.

While this proposition is not exactly true, it is true enough for all practical purposes, and may be taken as true without any great error. It is evident, also, that the proposition refers only to "direct" systems of heating and not to indirect systems.

Now, let us assume that our standard temperature for inside air is 70°; that our standard temperature for outside air zero degrees; and that the temperature of the steam or hot water in the radiators shall be t_4, when the inside air is 70° and the outside air is zero degrees. Then, from the proposition just given, we have

$$\frac{t_3 - t_1}{t_1 - t_2} = \frac{a}{b} = \frac{t_4 - 70}{70}$$

From this equation we get,

$$t_3 = \frac{t_1 \times t_4}{70} - \frac{t_4(t_4 - 70)}{70}$$

* Presented at the New York meeting of the American Society of Heating and Ventilating Engineers, January 22-25, 1895.

In this equation, it must be remembered, t_4 is the guaranteed temperature of the steam or hot water when the temperature of the inside air is 70° and that of the outside air is zero degrees; t_1 the temperature of the inside air, when the outside air is t_2 and the temperature of the steam or hot water is t_3.

To show the use of the equation assume the following example:

A contractor agrees to put in a heating system that, with 5 pounds of steam by the gauge, will keep the inside air at 70° when the outside air is zero degrees. He makes a test of the heating power of the system when the outside air is at 10°, and with a gauge pressure of 3 pounds of steam keeps the temperature of the air inside at 75°.

Here we will assume that the temperature of steam in the radiators is that corresponding to the pressure in the boiler; then t_4 is 227, the temperature corresponding to a gauge pressure of 5 pounds, t_1 is 75 and t_2 is 10. Putting these values in the equation for t_3 we get:

$$t_3 = \frac{75 \times 227}{70} - \frac{10\ (227 - 70)}{70} = 222.5$$

The gauge pressure corresponding to 222 5° is about 3½ pounds, so that, as the building was heated during the test with a gauge pressure of 3 pounds, the system would seem to have a slightly greater heating power than called for by the contract.

In the case of open hot water systems of heating the test may be run with the outside air at almost any temperature, as the hot water in the heating system may have any desired temperature less than 212°, and not run the temperature of the inside air above 70°, while in the case of low pressure steam systems the test cannot be made when the outside air is much over 10° without running the inside temperature up to 80° or 90° during the test.

I have assumed that when the temperature of the outside air is zero degrees and that of the inside air is 70°, the temperature of the water in the radiators will not average more than 200°, the temperature of the hot water entering will be 210° and that of cold water leaving the radiator will be 190°, and have calculated the following table showing what the average temperature of the water in the radiators ought to be. in order to keep the inside air at 70° for different temperatures of the outside air.

Table I.

Temperature of outside air.	Average temperature of water in radiators.	Temperature of water entering the radiators for a fall of 20°.
0	200	210
5	191	201
10	182	192
15	172	182
20	163	173
25	153	163
30	144	154
35	135	145
40	126	136

A custom of reducing the heating power of systems to a common standard would be somewhat similar to the custom that now prevails among mechanical engineers of reducing the evaporative power of boilers to a common basis. Tests to determine the evaporative capacities of boilers are made under widely different conditions of gauge pressure and temperature of feed water, but all water evaporated is reduced to "water from and at 212°." I propose, therefore, that in determining the heating power of heating systems tests be made and the results of all tests be reduced to standard conditions.

The standard condition for hot water systems shall be: An average temperature of 200° in the radiators to keep the inside air at 70° when the outside air is at zero degrees.

The standard condition for low pressure steam shall be: A pressure of 5 pounds. by the gauge, in the boiler to keep the inside air at 70° when the outside air is at zero degree.

If tests were made to determine the heating power of direct radiator heating systems, and were reduced to the proposed standard conditions, the profession would soon acquire a lot of valuable data as to the required ratio of heating surface to cooling surface for various conditions of exposure and various classes of building. I can see no valid reason why such tests should not not be made upon heating systems, and their heating powers reduced to the manner proposed. Such a method of determining the heating power of plants would undoubtedly be of value to the contracting heating engineer, as he would not then be obliged to wait for zero weather in order to determine whether or not the heating power of a plant was as guaranteed.

Below is given a table showing the gauge pressure required to heat the air inside of a building to different temperatures for various temperatures of outside air, and the heating power be equivalent to that required to heat the same building to 70° in zero weather with steam at 5 pounds by the gauge:

A Short Talk on the Construction of Hot Water Radiators.*

BY J. J. WILSON, TROY, N. Y.

My only apology for inflicting this communication upon you is a desire to offer for your consideration a few suggestions of importance relating to the construction of radiators for hot water heating. It has been an idea with many engaged in the heating line that it is necessary to purchase a high priced radiator in order to have it prove satisfactory. This, however, has not been my experience. The shape of numerous high priced radiators is such that, while suitable for steam, they do not represent the best type of radiator for hot water heating. It is a well-known fact among the trade that, owing to the phenomenal increase in this system of heating, many radiators formerly used for steam heating were put upon the market for water without any changes, and in cases where they lacked top connections between the sections they were added, very little thought or attention being given to their internal capacities or outward shapes, and there is no doubt that it has been a detriment, in some instances, to the success of this system of heating, requiring much more fuel to heat certain styles of radiators, owing to their large internal capacities for holding water, and entailing extra work upon the boiler to heat a certain number of square feet of radiation.

I will admit that there is a necessary volume to the body of water as it passes through the radiator sections which it would not be well to reduce. This volume, however, has not as yet been definitely established. To more clearly illustrate my meaning, I shall make a comparison: A bath or range boiler 16 inches in diameter and 48 inches in length will contain 9651 cubic inches, or a water capacity of about 42 gallons. The surfaces of the boiler amount to about 19½ square feet, and if the boiler surface were not galvanized, and its location such that air could pass freely over its surface, it would heat a room 6 x 9 x 10 feet, or 540 cubic feet of space, having average wall and glass exposure, to a temperature of 70° in zero weather, with the water at from 160° to 170°.

I offer, in contrast to the above, a radiator the actual size of its water section, independent of feet, being 33 inches high, 9 inches wide, and 1¼ inches thick, its internal capacity averaging a pint of water to the square foot of heating surface, and the actual surface of section backed by water being about 6 square feet. Using the volume of water in the range boiler and distributing it among the sections of the radiator it would furnish water for 336 square feet of heating surface, sufficient to heat a schoolroom 36 x 28 x 12 feet with average glass and wall exposure, but with only one change of air per hour, to 70° in zero weather, the temperature of the water being from 160° to 170°. There are radiators which may, in a measure, be likened to the range boiler, containing the maximum amount of water in their internal surfaces to the minimum square feet of heating surface.

During the past year I examined a hot water plant which had been in use two winters, but failed to give the guaranteed results, viz., a temperature of 70° in zero weather with the water at 170°. The boiler construction was favorable to a quick circulation, and under ordinary circumstances equal to heat the amount of surface attached to it. I examined the piping valves, fittings, &c., to discover anything which would be detrimental to the water circulation, but found them correct. The radiators were then measured and found to contain the necessary amount of surface to heat the required space. Upon making a rough measurement of the internal surface of these radiators, it was discovered that they would average nearly a quart of water to the square foot of heating surface. Here it was very evident that the boiler had double work to perform, or twice the amount of water to heat per square foot of heating surface over the radiator which would average a pint of water to a square foot of surface. I suggested the use of another radiator, but I have since understood that the plant was removed without this trial being made, which I feel assured would have corrected the trouble. This is a most important factor in the successful working of a hot water boiler, viz., the amount of water to be heated per square foot of heating surface in radiators. Another important matter connected with the

* Presented at the New York meeting of the American Society of Heating and Ventilating Engineers, January 22-25, 1895.

construction of radiators which seems to be entirely overlooked by the trade is the grade or class of iron used in their manufacture. I have a customer who, after installing a heating plant, was compelled to remove the radiators used and substitute others in their place. This party is an experienced heating engineer, and had many heating plants in the same vicinity in which heating surfaces were apportioned the same, the conditions of exposure being equal and the results satisfactory. The unsatisfactory plant had been erected in the early summer, and during the first cool days of autumn its deficiencies were not noticed, but when the cold days of winter appeared a marked absence of heat could be felt. The boiler was large enough for the work to be performed. The system of piping was examined for mistakes and trappings; none were found to exist. It apparently was a problem that could not be solved. The idea then occurred that the radiators might be responsible for the results. The internal openings were examined for imperfect construction, resulting from dropping of cores, &c , in the sections, but the circulation was found perfect. Finally he wrote the maker of the radiators, who at once claimed they were all right, and offered to take them back if he could definitely establish the fact that the radiators were responsible for the conditions existing. A radiator of another make was procured, which was of sufficient size to heat a selected room, connected up to the system, and found to thoroughly heat this particular room. The balance of the radiators were removed and others substituted in their place with the result of the entire building being well heated and entirely satisfactory. The radiators which were removed were of a class which had usually given good results. They were shipped back to the factory and in transit a section was broken, the fracture revealing the fact that the iron was exceedingly hard and brittle, its structure being very close grained and of a silver color, indicating the presence of sulphur in the iron, possibly caused by sulphur in the coke used in the cupola for melting the iron. The internal passages in the sections of the radiators were very rough and had an appearance of slag, supposably caused by the use of a large amount of scrap iron in the casting mixture. This shows the vast importance of using a good quality of iron, one which has the maximum of porosity with high tensile strength.

The competition in the sale of radiators is the cause, no doubt, in some cases, of the use of inferior grades of iron in their construction, and while the effect may not be so pronounced as above mentioned, it is undoubtedly an obstruction to the free passage of the heat units emanating from the element used for heating the radiators. My experience has been that a radiator, rectangular in shape, with flat surfaces, and containing about a pint of water to the square foot of heating surface, will give good satisfaction for water heating, other details of construction having proper attention, such as the proper spacing of sections, permitting a free circulation of air over their surfaces, the connections between the sections being free from any projections which may impede free circulation of water. Ornamentation which increases the thickness of the iron in the sections is detrimental. Surfaces in direct radiation not backed by water should not be rated as effective surface, and where possible the preference for decorating radiators should be by metallic bronzes, their conductivity being much higher than enamels. A preference should also be given to radiators whose connections between sections are such as to permit the fitter to connect and disconnect them, allowing the assembling of radiation into required sizes from stock on hand, which is a decided advantage during the season when radiator factories are pushed to their utmost to fill orders. A failure to ship radiators promptly often causes vexatious and expensive delays. I hope our society in the near future may be in a position to obtain, by experiment and research, positive data on the details above mentioned appertaining to the construction of radiators for hot water heating.

The Heating and Ventilating Engineer — A Commercial View.*

BY STEWART A. JELLETT, PHILADELPHIA.

I was much interested in a recent editorial in an English paper, on the subject of "Professional Fortunes," which the writer opened by advising all young men starting out to make their fortunes "to avoid the service of the State and all the professions alike." He then contrasted the fortunes made in trade with those of high and able offices of the Crown, and the leading members in the profession of the church, medicine, law and engineering.

The article is written from an English point of view, but it applies with equal force to us. Few, if any, of the great American fortunes have been made by professional men, and I have no knowledge of any among those engaged in our branch of engineering. Possibly I underrate the wealth of my fellow members.

The tendency in trade over the civilized world to-day seems to be downward. In some foreign countries it has apparently reached a starvation basis, from which there is as yet no prospect of relief. In America I regret to see the same tendency, in the increased numbers of the unemployed in our large cities, due in a great measure to unrestricted immigration, and the gradual reductions made in the price of goods, and, it follows, in the cost of producing them.

The maximum of quality or results for the minimum of cost is the demand of the buyer, and the manufacturer is striving to meet the conditions by improved machinery, systematized processes, and reduced wages and profits. The merchant is meeting the problem better by the enormous growth in the scale of everything in which business can be done. The world is his market and the printing press his salesman.

Changes in the methods of doing business enable him to carry his trade mainly on credit. I question if, in any legitimate business to-day, the margin of profit is as great as 20 years back, but where the enterprising merchant of that time had 100 customers his successor of to-day has 1000. It is the magnitude and multiplications possible in trade, and the rapid receipt and delivery of goods, enabling four to five times the volume of business to be done on a given capital, that accounts for present day mercantile fortunes.

This advantage in scale is entirely wanting to the professional man, as his business requires him (at least to a great extent) to come in personal contact with his customers, and there are but ten hours in a hard worked day. If he be a doctor he must listen to the plaints of his patients, if a lawyer to the woes of his client, or if an engineer to the needs of his customer or the troubles of his contractors, all of which involve time. If these matters are delegated to assistants entirely he loses custom, and with custom income. It is unfair that this condition of things should exist. The engineer who has devoted years of careful study and thought to perfecting himself in his profession should be, and is, in all fairness, entitled to the same returns with his brother merchant of equal ability. It is true, however, that the phrase "For professional service rendered" on a bill has to many men a different sound from that of "To merchandise furnished"

It is with the thought of improving the commercial position of the heating and ventilating engineer that I submit this sketch for your consideration, trusting that it will open a discussion that will point the way to improvement. "We cannot make headway as individuals; we can only make headway by acting as a body."

And it is by correcting the existing abuses that I believe we can make most headway at present. The broad motto of the business world is the "Maximum of business at the minimum of expense." Let us apply this to our branch of trade, thoughtfully considering the many unbusinesslike methods that have been allowed to take root and grow. Should it not in our case be reversed, the maximum of expense for the minimum of business? I think so, and believe that you will agree with me when you consider the matter in detail.

The adage, "Competition is the life of trade," is capable of misinterpretation. Competition can overreach itself and become the death of trade, and unregulated competition is to-day the bane of many branches of engineering, and particularly our own. I quote from the Bulletin of the National Association of Builders: "While we are all competitors, and sometimes sharp competitors, we should still stand firmly together for the correction of errors in practice and in principles of action."

The business of heating and ventilating as carried on to-day is capable of three divisions:

1. The engineer who plans and supervises only.
2. The engineer who contracts only.
3. The engineer who does both.

The first is dependent wholly for his income from fees received for services, and he is consequently affected by the business methods of the third, who plans as well as contracts. The second looks solely to the profits of his contracts for his remuneration, while the business of the third, if rightly conducted, should pay a profit in each division. Let us now consider the abuses that most need correction. I would place first of all the practice of making plans and specifications for architects and owners free of expense to them. The committee who drew our constitution were impressed with the necessity of correcting this (see article 1, subdivision 8), "to establish a uniform scale of prices for all professional services."

The scale is nearly uniform now, I regret to say, but, like the winds of heaven, uniformly free to all. I have heard contracting engineers say that this custom has obtained such a firm

* Presented at the New York meeting of the American Society of Heating and Ventilating Engineers, January 22-25, 1895.

hold that to refuse to render such services free would kill their contracting business. You can all readily see the effect of such an unbusiness like practice. It largely kills the business of the consulting engineer, and takes a large part of the legitimate profits made in contract work to meet the expense of making these plans and specifications.

Many of our architects have one or two concerns to whom they send their building plans regularly to have the heating and ventilating and power systems carefully worked out, but with no thought of paying for such services. There is no sound reason why this abuse should not be at once corrected, and there are good reasons why it should be.

1. It is unfair to the consulting engineer, who manifestly cannot render such services free.

2. It is unjust to the general customers of the contracting engineer who does it, as the expense of doing it must come from the work done for them, and for which they are paying.

3. It places the architect who accepts such gratuitous services in a position to be justly criticised, as he must either be unfair to the engineer from whom he accepts such service, for which he himself is being paid, or he must be unjust to his client if the acceptance of such service affects his judgment in deciding the award of contracts for the work.

4. It is not business, viewed from any standpoint, and is unjustifiable. Let us, therefore, not adjourn this our first annual meeting until we have taken the necessary steps for an immediate and radical change in this department.

The present forms of specifications we are asked to bid on, and the contracts presented for our signatures, are also a proper subject for your just criticism. There are many specifications handed us for estimates which do not describe in any complete manner the work to be done, but this slight oversight is taken care of, so far as the owner is concerned, by some such clause as this: "The material and workmanship throughout must be entirely satisfactory to the owner and the architect, and the system must be guaranteed in every respect to do the work asked for to their satisfaction." I would advise all our members not to sign a contract with the word "satisfactory" in it. I hold that what cannot be defined or accurately stated should be left out of the specifications.

Who can estimate what it will cost to do anything to another man's satisfaction, one whom possibly he does not know? It came into use in the days when heating was largely a matter of faith in the party employed to do the work, and when there was no general or definite knowledge of the subject. It is the outgrowth of methods that do not exist to-day, and its use should be dropped. The buyer should be required to decide whether the thing he is asking you to do, when done as specified, will be satisfactory to him or not.

Another relic of the days of faith in the heating business is the clause requiring a guarantee of temperature. You have doubtless all read the interesting correspondence on this subject in an engineering journal published in New York in answer to a letter written them by one of my partners. It will not, therefore, be necessary to enlarge on this subject. But why, I would ask, should a contractor when asked to bid on a definite amount of heating surface and boiler, located exactly on a plan, sizes of pipes, &c., being given, and the character, exposure and use of the building, better known to the maker of these specifications than to himself, be asked to guarantee the result? The contractor is asked to insure the results of another's calculations, for which insurance he collects no premium and for the practical determination of which guarantee he is often dependent on the employees of the owner. There is certainly no equity in this requirement, and the margins of profit on the labor and materials entering into the work do not justify the risk.

Our society should also protest strongly against the use of the inferior material that is now crowding the market, and insist that the standard be raised, advising the use of such materials only as they can conscientiously recommend.

There are, no doubt, numerous other abuses, some local, others general, that need correction, and that will be adjusted as we grow to appreciate more the benefits of our society. Those I have pointed out seem to me to first need attention. I will close by quoting from the Bulletin of the National Association of Builders, which is as applicable to our business as to that of the builder:

"The present custom of interpreting drawing and specifications is inherently unfair, notwithstanding the fact that many buildings are annually erected without serious difference between the contractor and architect; the contractor is allowed no voice in the settlement of questions that are of vital pecuniary interest to him. Contractors have always submitted to a large amount of injustice in the demands made upon them, but there is no good reason why they should continue to do so."

Polluted Well Water.

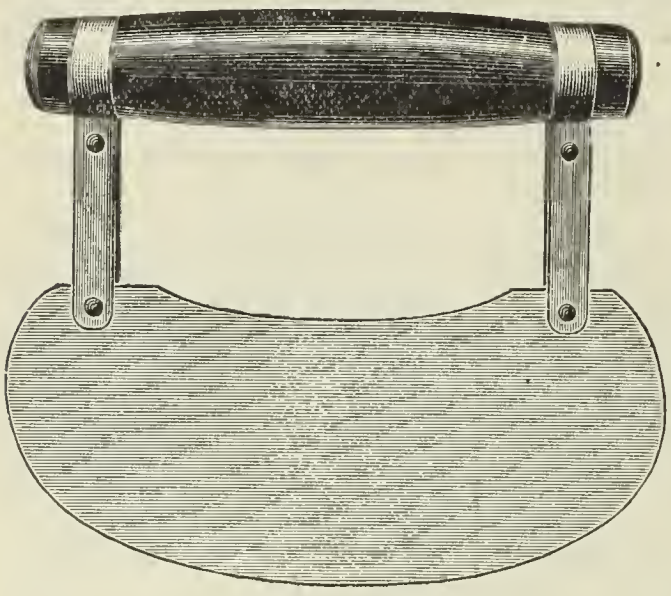
From an interesting article on the "Well Waters of Our Farm Homesteads," read at the Montreal meeting of the American Public Health Association by Frank T. Shutt, Chief Chemist of the Dominion Experimental Farms, Ottawa, Canada, we quote the following remarks on testing water:

I feel that I should, in closing this paper, make a brief reference to the efficiency of the so-called tests in diagnosing a water. I am aware that many are of the opinion that reliance may be placed on the results of a qualitative examination by means of the sugar test—nitrate of silver and permanganate of potash—used alone or in conjunction. My experience leads me to believe that such results are frequently misleading. The amount of precipitate by nitrate of silver when the reagent is used qualitatively can only be conjectured, and from it no correct inference can be drawn unless something is known of the strata of the district and the amount of free ammonia that accompanies it. The decolorization of permanganate of potash is still more fallacious. Peaty and upland waters will discharge the color from a comparatively large quantity of permanganate of potash, while we often find very little of this salt required by water reeking with the decomposing products of excreta. The color and appearance of a water cannot be relied upon as indicating the purity or impurity of a sample. Many waters that have no marked odor prove on examination to be seriously contaminated. A water may be colorless, bright and sparkling, and yet dangerously polluted, while on the other hand, dissolved peaty matter of a comparatively harmless nature may tinge a water with a suspicious yellow color. There are, I believe, but few cases (and those of very bad and very good waters) where complete analysis is not necessary to a correct diagnosis. In our laboratory we always determine the following chemical data: free ammonia, albuminoid ammonia, nitrogen in nitrates and nitrites, chlorine, total solids at 105° C., oxygen absorbed at 80° F. from permanganate of potash in 15 minutes and in 4 hours, and phosphoric acid (qualitative). The results are returned in parts per million.

Some Wonderful French Schemes.

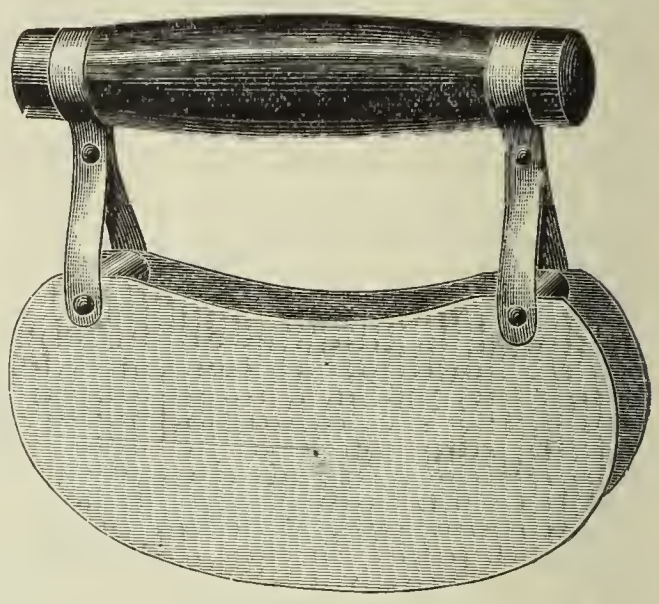
Plans and proposals for the projects of the International Exhibition at Paris in 1900 are being examined by a jury composed of prominent architects, artists, financiers, officials and others. The plans, models and designs are now on exhibition in the Palais des Industries and are exciting considerable interest, says *Le Figaro*. When the prizes were offered 664 aspirants applied for competition, but only 108 of these have completed their works, which now occupy 23 rooms in the Palais des Industries.

As the taking down of the Eiffel tower would cost the French Government 14,000,000 francs indemnity to the owners, besides the expense of demolishing it, most of the projects retain it as a feature and some use it as a basis of more or less ingenious and phantastic monuments. Plan No. 5 shows an immense aquatic castle on the Champ de Mars, which is considered as immersed for the occasion. No. 7 covers the entire Machinery Hall with a number of Russian cupolas and makes it a center of display of electrical illumination. No. 10 covers the entire Champ de Mars with an immense building. No. 14 places a tower on Machinery Hall, topped by an immense globe representing our planet. No. 16 lays parts of the Eiffel tower upon its side and builds two enormous elephants, decorated in East Indian style, and the interior furnished with restaurants, ballrooms, &c.



Another project raises the Eiffel tower to 1539 feet, and makes of it a monument of our century, decorating it with sketches from the various periods of our civilization. This projector will also dig a well 9000 feet deep. No. 20 puts in place of the tower a great monumental building as a corner stone for the twentieth century. One architect covers the entire expostion with a glass roof and erects an immense crystal palace. Bridges, columns, viaducts, railroads, mosques, ships, halls, palaces, &c., appear in endless variety.

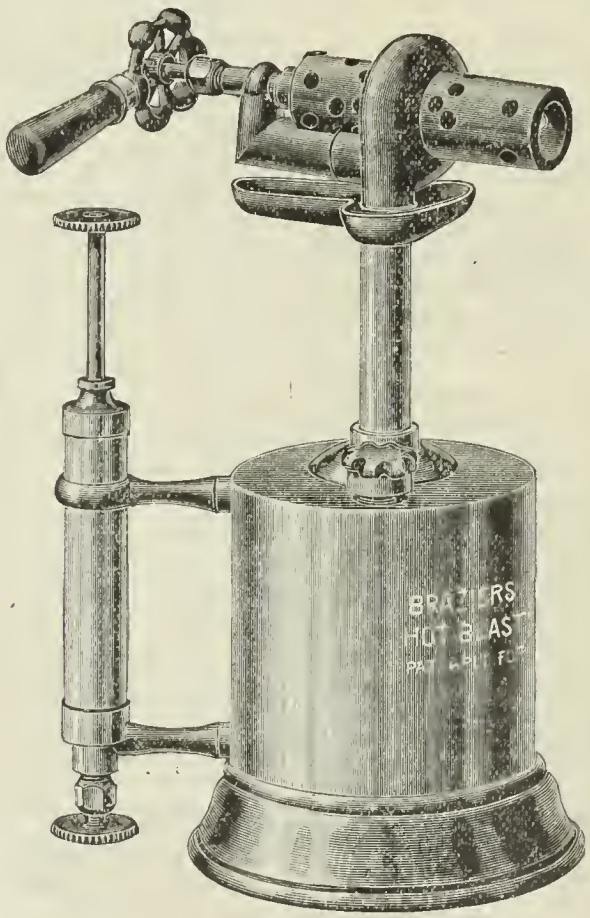
A very interesting plan, magnificent in its conception, is No. 61. It makes the Palace des Industries the central point and has a straight line boulevard to the Champ de Mars, offering from all points perspective views of the grounds. He changes the Trocadero, turns Machinery Hall into the Art Building, provides for reproductions of the Acropolis of Athens, St. Mark's Place of Venice and principal monuments of architectural art, but retains nearly all the building of the exposition of 1889. This plan has so far found the greatest approval, as it is the most economic, artistic and perfect to all outward appearances.



THE RETAIL STORE.

Daisy Mincing Knives.

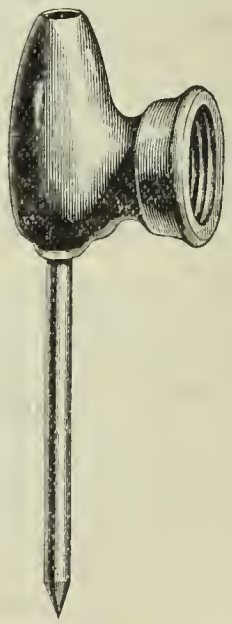
A. S. Henn & Co., New Haven, Conn., are offering the Daisy mincing knives, as here shown. The blades are attached to the handles by means of steel bands or supports, which are forced around the handle and the two sides riveted together. This method, besides strengthening the knife, it is remarked, keeps the wood handle from splitting. There are three numbers of each style, the handles of all being wood, enameled. Two numbers of each kind have nickel plated tips and two are full nickeled.



Daisy Mincing Knife, Single.

Daisy Mincing Knife, Double.

Hot Blast Brazier's Furnace.



The accompanying cut illustrates a new gasoline brazing torch, made by the White Mfg. Company, 40 and 42 State street, Chicago. It in designed and constructed especially for brazing bicycle frames, band saws and all other light work. It can be used in the open air or against a coke backing. When not in actual use the me may be reduced and still retain the heat in the generator while the work is being prepared for brazing. The method of its use is as follows: Having prepared a joint for brazing, the needle valve is unscrewed to give the full force of the flame; when the job is completed the needle valve is screwed in, which retains the flame in the generator, thus saving the fluid without reducing the heat in the generator; the process may be repeated for two hours without refilling the tank. Every tank is tested to 40 pounds pressure, which is the limit of pressure that can be put on the tank with the pump thereto attached. The tanks are spun from No. 20 gauge bronze metal, the bottom being spun in and soldered. All parts are made interchangeable to facilitate repairs.

Hot Blast Braziers' Furnace.

The Eclipse Lawn Sprinkler.

The Crescent Brass & Iron Works, Detroit, Mich., are introducing for the coming season a lawn sprinkler as here shown. It is made of cast iron, and is japanned in bright vermilion. It is explained that it differs from the Crown sprinkler, made by the same firm, in having no revolving parts, that it cannot be demolished when stepped on, and that it will last a lifetime. The sprinkler is made for ¾ inch hose attachment, and distributes the water evenly, it is claimed, over a circle of 36 feet in diameter.

The Eclipse Lawn Sprinkler.

MEMORANDA.

THE CHICAGO STAMPING COMPANY, Green and Congress streets, Chicago, are constantly bringing out new goods in the line of tinware. They have just put on the market a fine line of funnels, in which the bowl is seamless and beautifully rounded into a bell shape.

THE TRADE will be interested to know that the Excelsior Mfg. Company, St. Louis, have been appointed agents for the sale of the Michigan refrigerators. These refrigerators are favorably known to the trade, having been on the market for some years past. The factory has recently increased its capacity and is in a better position to supply the demand than it has ever been before. Changes and improvements have been made in the refrigerators where they were deemed advisable, thus keeping the line abreast with the times. The Excelsior Mfg. Company are issuing a catalogue fully describing this line of goods, which will be sent to the trade on application.

IT IS NOT often that G. William Gilkey, who is one of the representatives of Lalance & Grosjean Mfg. Company on the road in New England, is caught napping, as he is one of the most active and enterprising of Yankee traveling men, and besides enjoys the distinction of wearing a silk hat with more ease and grace than any other man in the trade, with the possible exception of J. Sidney Smith. As the story goes, Mr. Gilkey recently having some little time to wait in the station at Greenfield, Mass., purchased a book, the title of which is variously given, but the majority agree that it was Ward McAllister's "Guide to Correct Dressing and Deportment." However that may have been, it was so interesting that our traveler failed to notice the lapse of time and allowed the last afternoon express for Boston to pull out without him. Of course this is something likely to happen to any one, but it becomes remarkable in connection with the hero of this incident because it is a proverb that Gilkey never gets left.

THE GRAND RAPIDS REFRIGERATOR COMPANY, Grand Rapids, Mich., send out a little circular that is particularly artistic in its design. It is a small pamphlet measuring only 3½ x 6 inches in size. It begins with a sectional view and description of the Leonard cleanable cold dry air refrigerator, which is the particular product of the Grand Rapids Refrigerator Company. Next comes a variety of amusing and pretty pictures calling attention with more or less directness to the merits of the Leonard cleanable. One of them shows Queen Mab, or one of her Court, charioted upon a Leonard cleanable. Among other beings whose portraits are brought into the story are brownies, salesmen, devils, countrymen, &c. In the middle of the pamphlet two enthusiasts are warmly grasping each other's left hands and swearing eternal friendship with the Leonard cleanable refrigerator.

NOTICE is issued by William M. Pasco, surviving partner of Winegar & Pasco, South Butler, N. Y., under date of January 15, that in order to close up the affairs of the late firm of Winegar & Pasco the entire stock of goods, consisting of shelf and heavy hardware, stoves, ranges, farm implements, paints and oils and all fixtures and lease of the store, &c., are offered for sale. Sales will be made in the usual manner until February 5, when the entire stock will be put up at public auction.

THE FIRM of Lawson & Dean, dealers in stoves, tinware, hardware and pumps, Tulahoma, Tenn., have been dissolved, C. M. Dean retiring, and T. D. Lawson continuing the business.

F. E. BROWNE, Los Angeles, Cal., issues a neat circular relating to F. E. Browne's tea and coffee urn. The coffee and milk jars of this urn are cast iron, porcelain lined outside and inside, and their bottoms are arranged to completely drain the jars. Various other advantageous features are alluded to. A broken view on the front of the circular shows the constructive features of the urn. Another circular issued by F. E. Browne relates to a lamp still for furnishing distilled water for drinking purposes.

THE E. STEBBINS MFG. COMPANY, Brightwood, Mass., have been appointed sole selling agents for the United States for the Little Giant traveling lawn sprinkler made by the Portland Lawn Sprinkler Company. This device was exhibited at the World's Fair and was a source of a great deal of interest, its power of locomotion attracting unusual attention. The particular feature of the sprinkler is that under ordinary water pressure it is able to move itself over the lawn in any direction, either in a straight line or circles, and may be set to travel a definite distance and to go at the rate of from 15 to 500 feet per hour, as may be preferred. It will throw water over a swarth from 5 to 50 feet in width, according to adjustment, and under the average pressure of water will drag 100 feet of hose. The sprinkler has been used in several places and has called forth very complimentary testimonials.

THE RINGEN STOVE COMPANY of St. Louis, Mo., have brought out a line of refrigerators which they are offering under the name Quick Comfort. These goods have been especially built for the company in the hard wood lumber region of Michigan, are finished with great care, and tastefully ornamented and trimmed with solid bronze hinges and locks in antique copper finish. The refrigerators are packed with charcoal and lined with polished zinc. The main points of merit, the manufacturers state, are found in connection with the cold air flues and the waste water trap. The air flues are movable and easily cleaned, being of such construction that they cannot bend, warp or get out of order. The waste water trap is said to overcome the objections urged against the ordinary trap, and is located at the bottom inside of the refrigerator where it is always in sight. It consists of a single piece which can be instantly removed and cleaned. The bottom of the provision chamber of the refrigerator pitches toward the back so that when the chamber is being cleaned it is only necessary to lift out the trap and the water will escape through an opening in the bottom at the rear.

Philadelphia Lawn Sprinkler.

The Philadelphia Lawn Mower Company, Philadelphia, are putting on the market the lawn sprinkler shown in the accompanying illustrations. The sprinkler is made of brass, and, as will be seen from Figs. 1 and 2, consists of a nozzle of cone shape, the upper or discharge end being perforated and having a screwed spud or nipple in its center; screwed to the nipple is a cone with a finely perforated disk forming its discharge end. Fig. 3 shows the sprinkler in operation. The water, in its course from the hydrant, is unobstructed until it reaches the perforated end of the nozzle which divides it into solid streams. The streams strike the

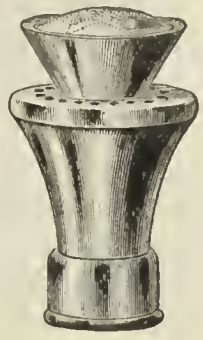


Fig. 1.—Philadelphia Lawn Sprinkler.

upper cone at a point above the plate, and are thus converted into spray, while the water which passes through the spud or nipple forms a fine center spray on its discharge through the finer

Fig. 2.—Sectional View of Philadelphia Lawn Sprinkler.

holes in the disk of the upper cone. By raising or lowering the cone on the nipple the space to be sprinkled may be regulated. Removal of the cone and the screwing of a cap on the nipple converts the sprinkler into a long range sprinkler for garden, lawn or

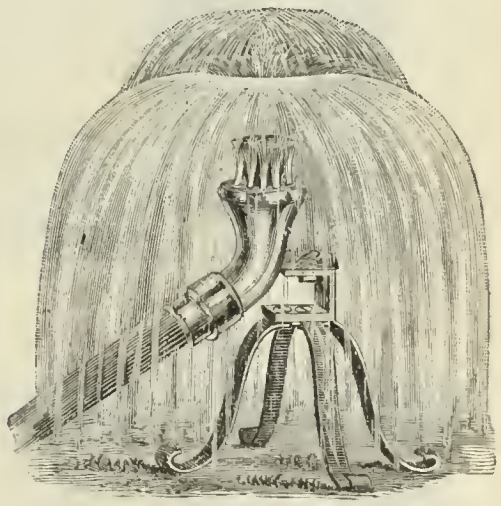

Fig. 3.—Sprinkler with Wrought Iron Stand.

flower use. The sprinkler is supplied in the straight style shown in Fig. 1, with a stand as shown in Fig. 3, with speed attachment for running it to the ground, and with a carriage having a hose reel attachment.

The trend of the cotton manufacturing industry toward the South is indicated in the announcement that five of the largest Massachusetts concerns in that line are now considering plans for the establishment of plants in the Southern States. Two New Hampshire companies have also applied to the State Legislature for permission to build cotton mills in other States. Economy in the price of labor and in freight rates is given as the reason for the projected move.

PLUMBING and GAS FITTING.

The Next Convention.

On the 11th, 12th and 13th of next June the National Association of Master Plumbers will hold their thirteenth annual convention at Philadelphia. The preparations that are being made for this convention will convey to those who attend a correct idea of why Philadelphia is called the "city of brotherly love."

Michigan Master Plumbers.

The principal feature of the third annual convention of the master plumbers of Michigan, which held its two days' session at Bay City last week, was the discussion of the proposed bill which is to be presented to the Legislature. The bill, if passed, will make it obligatory for every plumber to have a license from the State Association before he will be allowed to do any work in the State. The object of this bill is said to be to improve the sanitary condition of business blocks and dwellings and to insure first-class plumbing. At the convention the following officers were elected for the ensuing year:

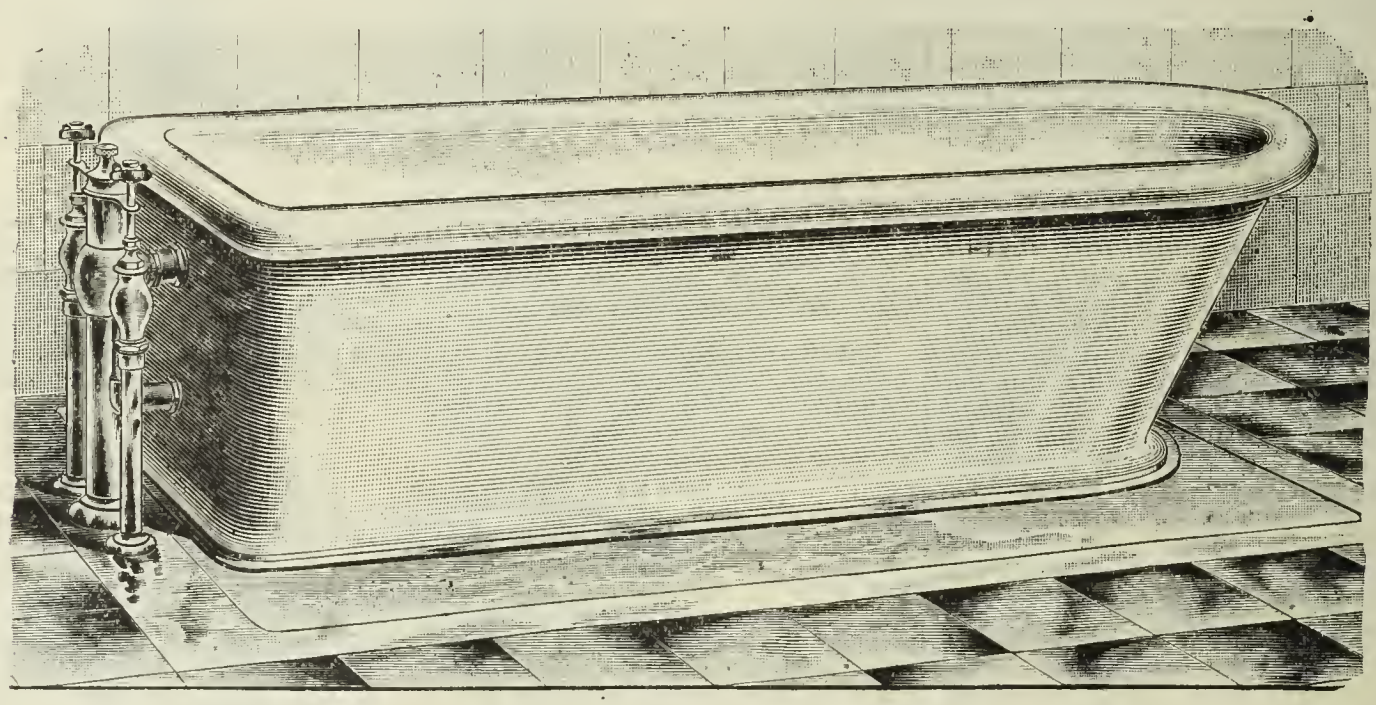
President, James Meathe, Detroit.

Vice-president, William H. Sullivan, Bay City.

Treasurer, Col. John A. Wheeler, Kalamazoo.

Secretary, Warren C. Weatherby, Grand Rapids.

Acting secretary, Benj. F. Guiney, Detroit.



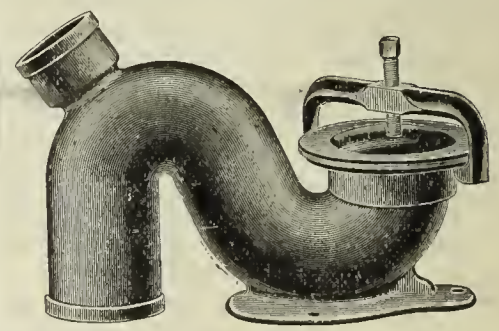
Executive Committee: E. E. Scott, Saginaw; George H. Porter, Jackson; W. W. Armstrong, Lansing.

Delegates to National Convention in Philadelphia: Wm. Lloyd, Manistee, and James Cooper, Pontiac.

A pleasing feature of the meeting was the presentation to President Meathe of a handsome gold watch, chain and charm.

The Puritan Bath.

The Puritan bath with roll rim, which is the subject of the illustration, is manufactured by the Dalton-Ingersoll Company, Boston, Mass., and was patented on August 21, 1894. The features of the bath which are specially noticeable are its sanitary qualities and low hight. It is made to set down on the floor so that its weight is distributed over a wide surface, and there is no possibility of dirt accumulating underneath it. It is 8½ inches less in hight than the standard iron tubs, or about 18½ inches from the floor to the top of the rim, making it especially advantageous for use with children or aged or fleshy people. The tub is of full size inside, and is made in four different lengths, 4 feet 9½ inches, 5 feet 3½ inches, 5 feet 9½ inches, and 6 feet 3½ inches, which is the extreme outside length, including the fittings. The baths are furnished in either porcelain or metallic enamel. Porcelain enameled baths are so well known that no further description is needed. The metallic enameled bath, however, is said to be new in this market, although it has been used in Europe for several years with satisfaction both as to appearance and durability. For smoothness of finish it is said to be superior to porcelain enamel, and should the metallic enamel wear off or become defaced the bath can be refinished in position so that it will look as goood as new, an advantage which needs no further recommendation.

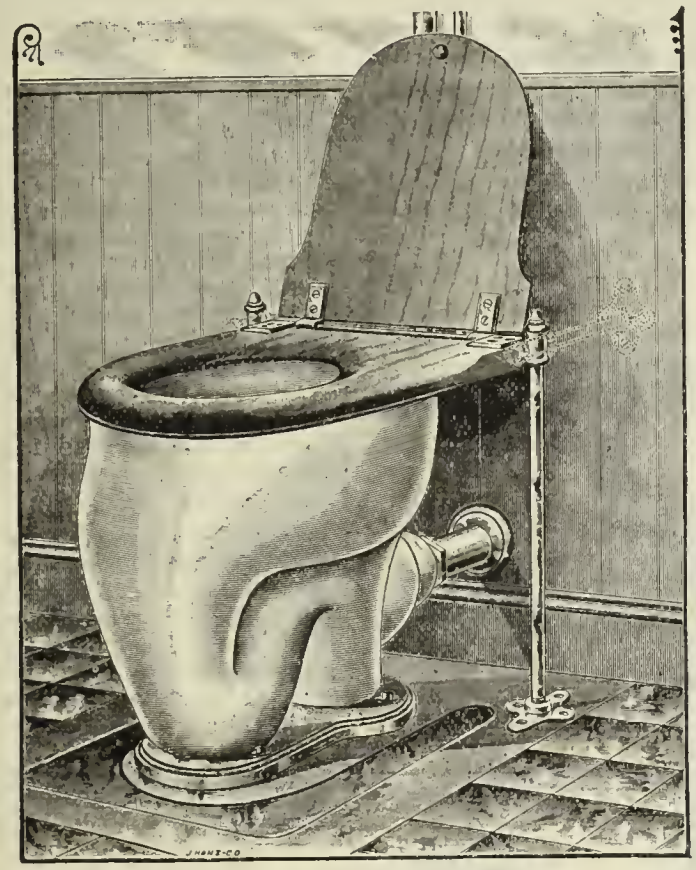


The Puritan Bath.

THE SANITARY INSPECTORS of Minneapolis, Minn., will receive scientific instruction upon the inspection of buildings and premises. The weekly conferences will be begun soon, and at each of them a lecture will be delivered upon some important thing arising in connection with the work of the department. Especial attention will be given to sanitary plumbing and the best and latest methods for the preservation of cleanliness, so that the inspectors will be thoroughly posted upon all matters of antiseptic disinfection.

S. & G. Clamp and Testing Cover.

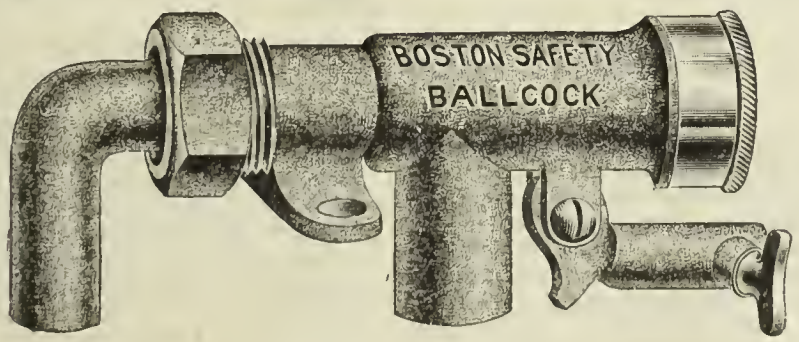
Sumner & Goodwin, 21 Oliver street, Boston, Mass., are introducing the S. & G. clamp and testing cover for iron hopper traps. The device shown herewith was suggested by the frequent blowing out of the old style testing plugs when in use in cities having laws requiring the testing of all soil pipe connections. As will be seen, the article illustrated consists of a circular rubber packing with corrugated face, which may be applied to the flange of any hopper trap; above this is placed a cast iron flange of same diameter, and to this pressure is applied on the upper side by means of a clamp and set screw.



S. & G. Clamp and Testing Cover.

The object in corrugating the rubber disk is to neutralize any little inequalities there may be in the face of the casting. The manufacturers claim that it is impossible for this packing to be blown out.

McDonald's Eureka Seat.

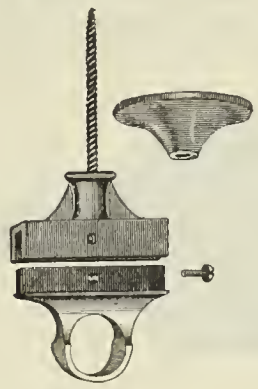


The A. Y. McDonald Company of Chicago have brought out a new seat on which they have applied for a patent. It is illustrated in the cut shown herewith. The special advantage of this seat is that it is clean and open in the back, thereby saving the time of fitting to the wall around the pipes. It can be fastened to the wall or floor as desired, but was specially designed to fasten to the floor, as in many cases seats cannot easily be fastened to the wall. Galvanized or nickel plated fittings are furnished, while the best materials are used throughout.

McDonald's Eureka Seat.

The Boston Safety Ball Cock.

The accompanying illustration shows the Boston safety ball cock manufactured by the Boston Brass Company, 40 Oliver street, Boston, Mass. This ball cock, which is described as noiseless, is designed for high or low pressure, and has, it is stated, been thoroughly tested under different pressures and conditions. It is constructed with a ground seat metal valve in the barrel, which works automatically from the pressure of the water. Whenever it is desired to renew the seat on the plunger worked by the ball float, or to empty the tank for any purpose, all that is necessary is to loosen the thumb screw and take out the ball. Then with the fingers the cap on the end is unscrewed, when the pressure of the water will close the automatic valve, thus shutting the water entirely off and at the same time push out the plunger which can be removed and any work done about the tank or pipes below it without shutting off the main supply. Or the cold water pipes can be tested without tying up the float in the tank. When the plunger is replaced the cap is simply screwed on and the whole thing is in working order. It is stated that the construction of the automatic valve is such that all singing or whistling noise and water hammer are avoided even under the highest pressure. These ball cocks are tested before leaving the factory and made with heavy copper balls and rods ⅜ inch in diameter.



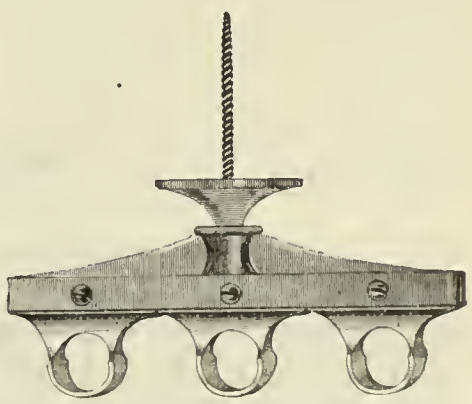
Boston Safety Ball Cock.

E. W. Stradling, E. J. Stradling, E. H. Bice, A. H. Dobson and John J. Droz were elected directors of the Stradling Plumbing & Heating Company, Utica, N. Y., at the annual meeting last week. The directors elected these officers: E. W. Stradling president; E. H. Bice, vice-president; E. J. Stradling, secretary; A. H. Dobson, treasurer.

Perfect Brass Pipe Hanger.

The increasing use of brass pipe in plumbing work has made a demand for suitable hangers for attaching the pipes to wall or ceilings. A very neat device for this purpose is manufactured by David L. Billings, 35 Hancock street, Dorchester, Mass., which we show in the accompanying illustrations. Fig. 1 shows the separate parts of a single hanger, while Fig. 2 shows a triple hanger ready for use. Referring to Fig. 1 it will be seen that the hanger consists practically of two parts. The upper yoke has a screw attached for fastening to the wall or ceiling, and in the bottom of the yoke is a longitudinal slit into which fastens the lower part of the hanger carrying the ring for holding the pipe. The piece fits into the socket, and is held in place by a screw passing through a hole in the metal. A small brass ceiling plate gives a finish around the screw at the top. The hanger is made entirely of brass highly polished and finished with either a flat or raised flange. In addition to the two styles illustrated there is also a double hanger. Special attention is directed to the simplicity of the device and the short time required to put it in place. The parts are interchangeable, which allows different sizes of pipes to be supported with the same hanger.

Perfect Brass Pipe Hanger.—Fig. 1.—Separate Parts of Single Hanger.



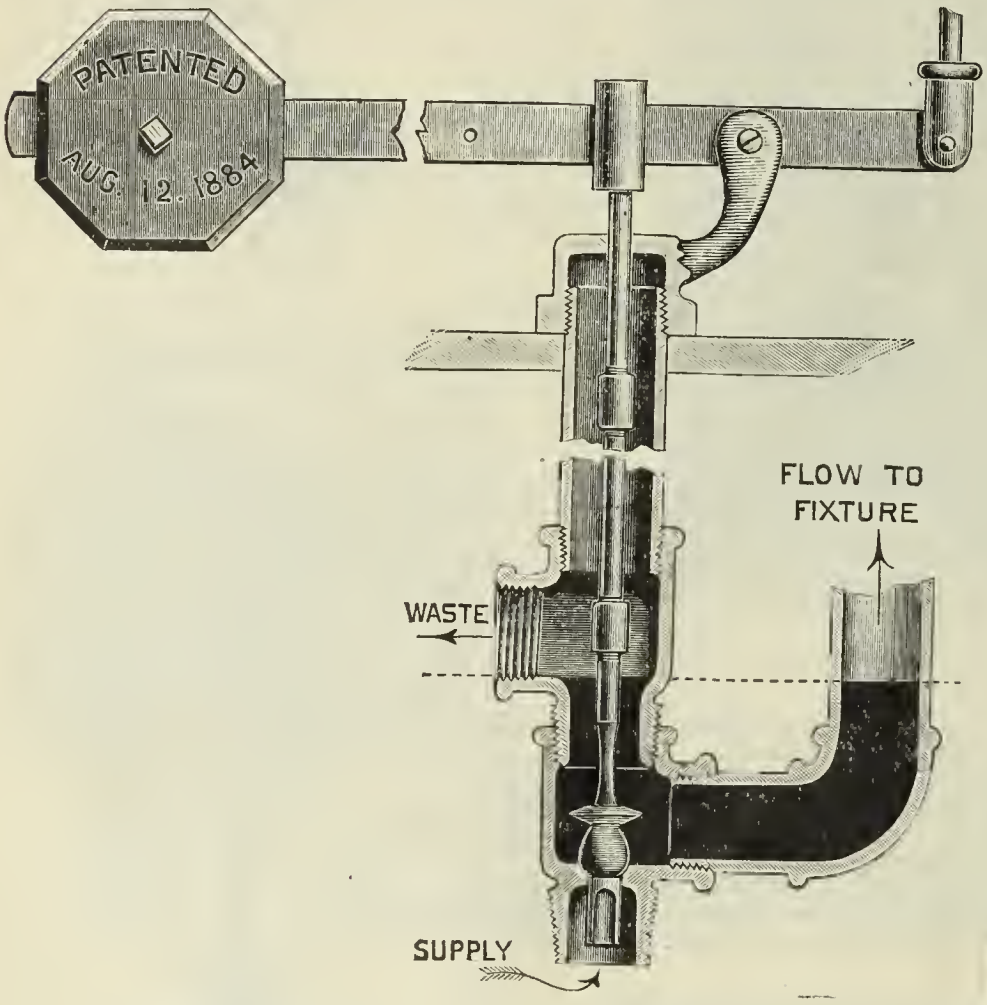


Fig. 2.—Triple Hanger Ready for Use.

The 1895 catalogue of the Zero Valve Company, 212 Seneca street, Buffalo, N. Y., has just reached us. Both the Zero and the Vollmer Anti-Freezing Closet Valves are illustrated and described, and we notice a new Zero Self Closing Stop and Waste Cock. Other pages show the Vollmer closet seat, which is a swing or lift seat, adapted for hopper closets. Their

valves and seats are also shown in connection with closets. The IXL Vent Cap is said to be a simple and durable affair that can be adapted to the hub end of any soil pipe by simply adjusting a set screw.

Zero Self Closing Stop and Waste Cock.

The illustration presented herewith shows the Zero self closing stop and waste cock for use in connection with any fixture that is exposed to the weather. It is so designed that it can be buried in the ground and does not require a vault or box to be built around it. From the cut it will be noticed that on opening the valve the supply water flows up a separate pipe to the fixture, and does not flow up the pipe

The Zero Self Closing Stop and Waste Cock.

in which the rod is placed which works the valve, and the valve is so arranged that it prevents the water flowing up in this pipe, preventing the rod or its casing from becoming gradually incased in ice and interfering with its operation. The waste being the full size of the pipe the probability of the waste being stopped is removed. It is further stated that when the valve is closed to stop the water supply the waste is so located as to prevent the entrance of sewer air, as the valve is effectually trapped. In case repairs are needed it is not necessary to dig the valve out of the ground, as it is arranged to use iron pipes, which may be unscrewed from the valve seat and the valve removed. The valves are made with rods and casing in lengths of 3½, 4 and 4½ feet.

Out of 50,000 boys who graduated from the senior department of the Board Schools of the city of London during the year ended May 31, 1893, and whose subsequent occupations were recorded, 123 became plumbers.

TRAPS AND VENTS.

The business heretofore existing under the name of H. L. Tillinghast & Co., Providence, R. I., will on January 31 dissolve, and after that it will be continued as the H. L. Tillinghast Supply Company, Incorporated.

O. H. Jones, representing the F. W. Foster Mfg. Company, Boston, Mass., was in New York this week visiting the plumbing trade in the interest of the Foster high pressure ball cock.

The Zero Valve Company, 212 Seneca street, Buffalo, N. Y., inform us that the Vollmer patents have been granted for the different self-closing valves which they manufacture.

A spirited and closely contested election for officers of the Master Plumbers' Association for the ensuing year was held at Elk's Hall, St. Louis. The election resulted in a great deal of wire pulling. Jeremiah Sheehan, who was defeated by William McMahon for the presidency, has been the presiding officer of the local assembly for two terms, and was once president of the National Association. Following is a list of those elected: President, John Mahon; vice-president, W. H. Kuhns; second vice-president Wm. Schwehr; recording secretary, Wm. F. McCormack; financial secretary, John P. Kelleher; treasurer, E. J. Lonergan; sergeant-at-arms, A. J. Gallagher.

The monthly meeting and dinner of the Plumbers' Supply Association were held at the Quincy House, Boston, last week. President Frank J. Knox of Hartford sat at the head of the table. The after dinner exercises were entirely devoid of formality and no business of interest was transacted.

Representative Elliott of New Haven, Conn., introduced to the Legislature at Hartford last week the bill to control plumbing in the State.

The plumbing firm of Murray & Wacker, College Point, N. Y., have dissolved partnership, and the business is now carried on by George Wacker alone.

The Rochester Lead Works, William S. Mandeville and Frank E. Shepard, proprietors, Rochester, N. Y., are to build a new plant especially adapted for the requirements of their business. The firm are extensive dealers in pig lead, pig tin and antimony, and large manufacturers of lead pipe, block tin pipe, tin lined lead pipe, solder and babbitt metal, and in making a selection for their works decided to locate near the railway. They have just purchased the coal yard property at the corner of Exchange and Edinburgh streets. The ground space gives 53 feet on Exchange street, and runs back on Edinburgh street 180 feet, backing up to the Erie tracks, where a switch will be laid for a track for unloading and loading cars. A modern two-story brick factory is to cover the entire ground space, and work on the new building will commence as soon as the plans are drawn and contracts let.

Lead pipe thieves are at work in the lower section of the city of Philadelphia to such an extent that the police are kept busy trying to catch them, while at the same time warning all real estate dealers to look after the fastenings of doors and windows of vacant houses.

The plumbing establishment of Cunningham & Stowe, Marion, Ohio, was visited by fire last week. Insurance covers the loss.

The Broadway Plumbing Company were incorporated, at St. Louis, Mo., with an all paid capital stock of $1000, to carry on a general plumbing, gas and steam fitting business. The shareholders are J. M. Life and Thomas Bond, each of whom owns 40 shares, and J. J. Shaw, 20 shares.

Macumber & Johnson of Worcester have leased a store in the Bugbee House block, Putnam, Conn., where they have established themselves in the business of plumbing, steam, water and gas pipe fitting.

A letter has been issued to the builders and contractors of Detroit, Mich., by W. E. Johnson, clerk of the Bureau of Sanitary Plumbing of the Health Department. The letter is issued as the result of several complaints in this direction where builders have paid for the plumbing and afterward found that it was not satisfactory to the bureau, necessitating changes and further expense. The Plumbing Bureau therefore advises that settlement be withheld until the plumber presents the certificate of final inspection by the department. The letter reads as follows: "An important section of the rules of the Board of Health governing sanitary plumbing and house drainage is: 'When work is completed and tests are satisfactory to the Plumbing Inspectors, a certificate of approval will be issued to the plumber by the inspector.'"

The local press of Dubuque, Iowa, freely praise W. S. Molo for the heating plant and plumbing work done in the new High School Building.

The New Haven Gas Light Company, New Haven, Conn., have voted to reduce the price of gas from $1.50 to $1.25 per 1000 cubic feet, to take effect

from March 1 next. At this figure gas can be profitably used for fuel, and the plumber will find it of advantage to make a push on the pipe fitting necessary for the use of gas stoves and to carry a selected line of gas cooking stoves.

THE FIRM of E. K. Lockwood & Co. of Norwalk, Conn., plumbers, steam and gas fitters, have been dissolved and will hereafter be known as the Jones-Hotchkiss Company, the members being F. I. Jones and H. E. Hotchkiss, E. K. Lockwood retiring.

THE CITY OF WATERBURY, CONN., says the New Haven *Record*, has reason to be proud of her new water works that have been under construction for some time past. The supply was tested last week with highest success, meeting in every way the expectations of the projectors.

A MASTER PLUMBERS' ASSOCIATION has been formed at Harrisburg, Pa., with the following officers for 1895: President, E. C. Rauch; vice-president, J. Wesley Neil; secretary, James H. Lutz; treasurer, John A. Kramer.

J. J. CROWLEY, Hyde Square, Mass., in connection with his plumbing business on Lamartine street has opened a new place on Massachusetts avenue in the Back Bay.

THE COMBINATION SINK AND TRAP formerly made by Johnston & Meyer, St. Louis, and recently illustrated in these columns, is now being made by the Pleuger & Henger Mfg. Company, St. Louis. The device has many points of merit claimed for it by the manufacturers, who are preparing a circular describing same, which will shortly be issued to the trade.

THE TORONTO STEEL CLAD BATH AND METAL COMPANY, Limited, Toronto, Ontario, at the recent convention of the Ontario Architects' Association held in Toronto, distributed as a souvenir a small memorandum book which is an exceptionally useful and pretty article. It is bound in fine leather and contains a removable memorandum book made up of both blank and ruled pages. On the front cover is a picture in gilt of the steel clad bath and the inscription, "Souvenir O. A. A, 1895. Compliments of the Steel Clad Bath and Metal Company, Limited."

A READING, MASS., plumber failed to comply with the law and had to do a job a second time to escape a fine.

WE HAVE PLEASURE in acknowledging an invitation from President Ahern to attend the Fifth Annual Convention and Banquet of the Connecticut Master Plumbers' Association, to be held at the Waterbury City Hall, Wednesday, February 6.

LAKE PLUMBING COMPANY have been incorporated at Chicago with a capital stock of $2700 to do a general plumbing business. The incorporators are William T. Payne, Guy C. White and Joseph B. Burtt.

IN the early part of 1893 the Master Plumbers' Association of Philadelphia decided to test the legality of the mercantile tax upon the plumbers. The test was made in the case of John Gormly, 1433 Columbia avenue, who was taxed $7, besides 50 cents as the city fee for issuing the license. The court decided the case in favor of Mr. Gormly to the satisfaction of President Eyanson and Secretary Clark of the association, as well as the 300 members, all of whom gave their support to Mr. Gormly.

WILLIAM HEAP has purchased the business of the Heap Manufacturing Company, at Muskegon, Mich., and will enter business for himself. He will build a new factory and manufacture sanitary goods.

A. F. HARVEY, Gloucester, Mass., has sold his stove and plumbing business to James S. Smith.

THE CONTRACT for repairs, &c., in the Garden Street School at Pawtucket, R. I., was awarded to the Pawtucket Steam & Gas Pipe Company.

J. M. WHITE, Bristol, Conn., has purchased the interest of his partner in the plumbing business.

THE PLUMBING ESTABLISHMENT of Leonard D. Hosford, at 43 Beekman street, New York, was visited by fire last Monday.

The Metal Worker acknowledges the courtesy of the Association of Master Plumbers of New York City in the receipt of tickets for their annual entertainment and ball, to be held in the Lexington Avenue Opera House on February 12.

COUNCILMAN DURFEE of Providence, R. I., presented a resolution directing the city solicitor to apply to the general assembly for certain legislation relative to the plumbing laws, which was passed. The object of this is to elect the inspector of plumbing biennially and to allow the city council to amend the plumbing ordinances.

Montreal Master Plumbers.

The Master Plumbers' Association of Montreal held its regular meeting Thursday the 17th; a large number attended, and much business of importance was transacted. President Lamarche announced that he had received notice of the passing of the act of incorporation by the provincial legislature, and that now the association was in possession of all the rights and responsibilities of a regularly incorporated company. It was decided to celebrate the inauguration of the association and the attainment of corporate rights by a banquet to be held in February. A committee was struck with full power to carry the business to what cannot but be a successful conclusion. The sanitary and legislative committees reported the completion of their work of revising the City Plumbing By-Law. It was resolved that the executive committee at once communicate with the civic authorities, with a view to getting the by-law amended, as suggested by the report of legislature and sanitary committees, and to take steps toward the better enforcement of the by-law.

A letter was received from the secretary of the Council of Arts and Manufactures reporting that the plumbing class was making excellent progress, and requesting the association to make suggestions as to a course of drawing for the class; referred to apprenticeship committee. A number of new members were added to the roll, which now contains the names of all the leading firms of the city. A master plumbers' association is about to be formed in the city of Quebec. The Montreal master plumbers are to be congratulated on the rapid progress made since their inauguration, only a few months ago. One of the leading physicians and surgeons of the city has kindly consented to lecture before the association in French and English. We believe the subject of the doctor's discourse will be the close connection between successful surgery and good plumbing. This is a phase of the sanitary question that has not received the attention that its importance deserves from leading surgeons.

News and Notes.

The Brazilian Government has ordered $5,000,000 worth of war material from the Armstrong Gun Company of England.

The "good roads" question is being actively agitated in New York State, and the employment of convict labor in this work is urged.

The House Committee on Labor has ordered a favorable report on the bill of Congressman Phillips of Pennsylvania, authorizing the President to appoint a commission of 15 members, including five representatives of labor, five business men and five farmers, to meet the problems presented by labor, agriculture and capital. The Commission is expected to exist for two years. It is designed to furnish Congress with information and suggestions as to laws that may be made a basis for uniform action by the various States in order to harmonize conflicting interests and to be equitable to the laborer, employer, producer and consumer.

Industrial reports from the South show a general tendency toward increasing business activity throughout that section. Several very important enterprises are being projected, with some assurance of their being carried out. Among them are two extensive steel plants, several large cotton mills and a number of mining enterprises.

A steel bridge across the St. Croix River, connecting Calais, Maine, with St. Stephen, N. B., was formally opened January 18.

Fifteen of the 25 regiments of United States infantry have now been supplied with the new Krag-Jorgensen rifle, and it is expected that, at the present rate, all the infantry regiments will be armed with this weapon before another three months have passed.

A system of water works has just been completed at Portland, Ore., at a cost of $2,000,000. The supply comes from Bull Run River, and is brought a distance of 40 miles.

The foreign trade returns of the port of New York for the month of December, 1894, show an aggregate gain of $15,725,000 as compared with the corresponding month of 1893. The increase is mainly due to heavy importations, which were nearly $12,000,000 greater than those of December, 1893. For the calendar year, however, the volume of foreign trade exhibits a falling off as compared with that of the previous 12 months, the aggregate of 1894 being $933,171,045, against $1,068,919,917 in 1893, and $1,053,756,430 in 1892. Imports of free goods were heavy, being $239,332,660, against $296,318,647 in the previous year and $154,025,758 in 1892. The value of dutiable goods imported, $203,537,304, is the smallest since 1879, and $38,845,205 less than recorded in 1893. Exports of domestic produce, $332,670,015, fell $15,412,513 behind 1893. Imports of specie were $20,669,377, against $65,827,758 in 1893, and exports, $129,003,594, against $106,398,025.

A bill is now pending in the Legislature of the State of Alabama to exempt from taxation for ten years all new industries which have an actual investment of $25,000.

TIN PLATES.

Tin Statistics for 1894.

The drop in the price of pig tin last year is readily accounted for by the large increase in the output of the metal. According to French & Smith's circular, the Straits settlements shipped 46,119 tons of tin in 1894, against 39,782 tons in 1893 and 34,150 tons in 1892. Australia exported 5821 tons, against 5722 tons in 1893. Sales of Banca and Singkep amounted to 6100 tons, against 5418 tons in 1893. Sales in 1895 will, it is said, be further increased. From Billiton about 500 tons less was received than in 1893, and the production of the Cornish mines is estimated to have also been about 500 tons less. Other sources of supply are also opening out. From Bolivia the receipts are steadily increasing, and with better transit facilities the output of the mines in that country is gaining in importance. Some parcels of high grade tin ore have also been received in England from South Africa.

New Tin Plate Scale.

We print below the new tin plate scale adopted in conference in Pittsburgh January 15, and which took effect the next day, to continue in force until June 30, 1895:

TIN AND BLACK PLATE MILLS.

It is agreed that at a 1⅛-cent Western Iron Association card the prices for rolling, shearing, doubling and heating on a tin and black plate mill shall be as follows, with 2 per cent. additional for each 1/10 advance of said card, and 2 per cent. decline for each deduction of 1/10 to 1⅛-cent card:

Gauges.	Rolling steel. 2,240 pounds.	Doubling.	Heating.	Shearing on jaw or crocodile shears, and job work on squaring shears.
Nos. 8 to 11	$2.04	$0.93	$0.85	$0.99
Nos. 12 and 13	2.13	.96	.90	
Nos. 14 and 15	2.45	1.10	1.07	
Nos. 16 and 17	3.24	1.46	1.32	1.52
Nos. 18 to 20	3.62	1.63	1.48	
Nos. 21 to 24	3.96	1.86	1.63	
Nos. 25 and 26	4 00	1.86	1.69	1.52
Nos. 27 and 28	4 01	1.96	1 82	
Nos. 29 and 30	4.50	2.36	2.17	1.54
No. 31	4.59	2 48	2.33	1.56
No. 32	4 80	2.60	2 44	1.65
No. 33	5.09	2.74	2.52	1.73
No. 34	5 64	2.91	2.76	1.93
No. 35	5 92	3.08	2.92	2.01
No. 36	6.32	3.15	3.03	2.15
No. 37	6 39	3.19	3 08	2.18
No. 38	6.46	3.26	3.13	2 21

1. Thirteen per cent. less than above prices for iron, except shearman.

2. Shearman on modern squaring shears to receive $1 per turn, but for 25 gauge and lighter, 87½ cents per turn shall be paid. This clause only applies for shearing tin plate.

(The above changes made in scale of 1894 and 1895 by conference January 15, to take effect January 16 and maintain until June 30, 1895.)

EXTRAS.

3. Twenty per cent. added for changed steel and 20 per cent. on net price of iron.

4. Seventeen per cent. added for pickle finished iron and steel, except shearman

5. For all sheets sheared into circles on tin and black plate mills where the loss exceeds 10 per cent. 20 per cent. extra shall be paid.

6. That all sheets cut down to smaller sizes on tin and black plate mills be paid for at scale prices.

Following is the old scale, which we present for purposes of comparison. The extras remain unchanged, but for shearing the old scale made the price for all gauges $1 per turn.

Gauges.	Rolling steel. 2,240 pounds.	Doubling.	Heating.	Shearing on jaw or crocodile shears and job work on squaring shears.
Nos. 8 to 11	$2.04	$0.93	$0.85	$0.99
Nos. 12 and 13	2.13	.96	.90	
Nos. 14 and 15	2.45	1.10	1.07	
Nos. 16 and 17	3.24	1.46	1.32	1.59
Nos. 18 to 20	3.62	1.63	1 48	
Nos. 21 to 24	4.07	1.86	1.63

British Tin Plate Exports in 1894.

Great Britain's total exports of tin and terne plates during the year 1894 show a decrease of 25,891 tons in quantity and of $5,077,198 in value as compared with the figures for the previous year. The figures given in the Board of Trade returns are as follows: 1893, 379,172 tons, valued at $25 958 240; 1894, 354,081 tons, valued at $20,881,042. Tin plate shipments to all countries in the last three months of the year, however, exhibited a considerable gain as compared with those in the corresponding period of 1893, December's increase in this respect being as much as 14 421 tons, 10,600 tons of which are accounted for by the comparative increase in exports to the United States in the last month of the year. The following table gives the amounts of British tin and terne plates sent to foreign countries during the past two years:

Exported to.	12 Months.	
	1893. Tons.	1894. Tons.
Russia	30,527	23,965
Germany	3,126	3,765
Holland	5,312	5,184
France	11,297	10,416
Portugal, Azores and Maderia	5,862	2,951
Italy	4,004	2,967
Roumania	4,286	4,675
United States	255,603	226,879
Brazil	4,329	5,316
Argentine Republic	3,299	3,200
British East Indies	6,190	7,974
Australasia	7,694	11,729
British North America	16,000	17,393
Other countries	21,633	27,667
Totals	379,172	354,081

SCRAP.

JOHN JARRETT of Pittsburgh writes to the New York *Herald* that, in his opinion, with the slight reduction in wages agreed to by the tin plate workmen, the American mills can be operated with a fair percentage of profit, and in two years' time so increase the output as to control entirely the home consumption.

TEN of the leading canning factories of Baltimore, which have been shut down since October 1, started into operation again on Monday. Other idle plants in the same business are likely to follow suit. This will mean an augmented demand for coke tin plates.

THE LEECHBURG FOUNDRY & MACHINE COMPANY, Pittsburgh, Pa., have contracted to furnish to the Falcon Tin Plate & Sheet Company, Niles, Ohio, a Mesta pickling machine, having a capacity of about 10 tons of black plates per hour.

EXPORTS of native pig tin from Great Britain in 1894 were valued at $2,074,512, and foreign tin at $7,310,626. Both totals show a decline in value, though the quantity of foreign tin reexported last year exhibits an increase.

THE COPARTNERSHIP between George C. Waldo and Frederick R. Phillips, trading as the Phillips Tin Plate Company of Philadelphia, has been dissolved by mutual consent, Mr. Phillips having purchased the interests of Mr. Waldo therein. The tin plate manufacturing business of the concern will be conducted by Frederick R. Phillips at the same location in Philadelphia, under the name of the Phillips Tin Plate Company, 918 Filbert street. The works of the concern are situated at Susquehanna avenue and Philadelphia & Reading Railroad.

THE WHOLE of the men, numbering about 1000, employed at the Cwmfelin Tin Plate Works, Swansea, Wales, were last week given a month's notice, terminating their engagements. There has only been one brief stoppage of these works in the past 25 years. E. Rice Daniel, the managing partner, stated publicly that the notices were given, not with the intention of closing down the works or reducing wages, but to enable the works to be kept going from day to day, until the market becomes sufficiently settled to justify the renewal of customary labor contracts.

REYNOLDS BROS. CAN COMPANY, Havre de Grace, Md., advise us that the report that they have the intention to manufacture tin plates is erroneous. The firm of Reynolds Bros. have been engaged since 1880 in the manufacture of fruit cans, and they also hold various patents in can making machinery. Their product in this line is known in all sections of the country, and they propose to confine themselves thereto. The concern were incorporated on January 1 last as the Reynolds Bros. Can Company.

A PRESS CABLE dispatch from Swansea, Wales, reports that at the annual meeting of the Chamber of Commerce of that port, on January 23, Sir John Jones Jenkins, chairman of the Swansea Harbor Trust, addressed the members, saying that the Welsh tin plate industry was threatened with severe competition from the United States, where tin plates would be extensively manufactured in the future. The decline in the Welsh trade being entirely in the shipments to America, he believed that other markets might be opened to make good the loss of trade with this continent. Already, he said, more shipments were sent from England to Russia than were sent to the whole world 40 years ago.

THE CHICAGO STAMPING COMPANY, Green and Congress streets, Chicago, have on exhibition in their sample room some of the new tin plate from which they will hereafter make their milk cans. The plate is of No. 18 gauge and has an unusually lustrous surface. It is made in their own tin plate factory on the premises. The new Morewood tinning machine is used and the company are highly pleased with the excellence of the work which it turns out. It is the intention of the company to begin at an early day the manufacture of a full line of roofing plates and bright plates for the trade.

THE LEECHBURG FOUNDRY & MACHINE COMPANY, Pittsburgh, Pa., have received an order for a Mesta patent pickling machine for the La Belle Iron Works, Wheeling, W. Va., to be placed in the new tin plate plant now being erected by that concern.

THE NEW CASTLE STEEL & TIN PLATE COMPANY, New Castle, Pa., manufacturers of tin and terne plate, have closed a contract with the Morgan Engineering Company, Alliance, Ohio, for a considerable amount of electrical machinery. The order consists of electric cranes and other time and labor saving machines for the manufacture of tin plate.

THE WORKS of the Tiryda Tin Plate Company, Ammanford, South Wales, have restarted this week, owing to concessions made by the workmen.

MCCLURE & Co., tin plate and metals, Pittsburgh, Pa., are furnishing their friends with a memorandum book which is sure to be highly appreciated. It is well gotten up, having a leather back, and the sheets are held together in a clasp, and when all have been used a new pad can easily be inserted. This firm are meeting with an excellent demand for McClure's redipped roofing tin, which is guaranteed to contain 35 pounds of coating per 112 sheets. It is a recognized fact that a very important point in a roofing plate is to secure a uniform coating. This firm state that the above brand of roofing tin is made by a process by which the coating is distributed evenly over the sheet, leaving no thick edges to interfere in working the sheets.

THE TIN PLATE PLANT of the St. Louis Stamping Company, St. Louis, Mo., has been shut down pending settlement of the wage scale with their workmen.

FOLLANSBEE BROTHERS COMPANY, successors to James B. Scott & Co., Pittsburgh, Pa., distribute a neat little circular calling attention to Scott's Extra Coated guaranteed roofing tin. Instead of filling the entire pamphlet with their own claims for the ware they let others who have used the plates record their experiences. A number of testimonial letters, which are printed in *fac-simile*, speak in the highest terms of this plate.

THE BRITTON ROLLING MILL COMPANY, Cleveland, Ohio, started up one tin plate mill on Monday, the 21st inst., and will have two mills in operation as soon as shipments of tin plate bars are ample. The wages paid will be on the basis of the 30 and 25 per cent. reductions proposed by the manufacturers, and the plant will be operated non-union.

M. M. GARLAND, president of the Amalgamated Association, was in Cambridge, Ohio, last week, for the purpose of organizing a lodge of tin plate workers among the employees of the Morton Tin Plate Company at that place.

LAST WEEK a charter was issued to the Pennsylvania Tin Plate Company of New Kensington, Pa., with a capital stock of $200,000. The directors are: Barthold Goldsmith of Pittsburgh, Philip Goldsmith, Louis Goldsmith, David Frankenberg and Edward Dinkelspell of New York City. The plant of this firm is rapidly approaching completion, the contract for its erection having been placed some months since with the Frank Kneeland Machine Company of Pittsburgh, Pa. It will be a modern plant throughout, and the concern will roll their own black plates.

THE ANNUAL MEETING of the Association of Iron and Steel Sheet Manufacturers of Pittsburgh was held in that city last week. The election of officers resulted as follows: J. G. Battelle, Piqua, Ohio, president; W. T. Graham, Bridgeport, Ohio, vice-president; John Jarrett, secretary-treasurer. Directors: B. M. Caldwell, Warner Arms, N. E. Whitaker, W. C. Cronemeyer and B. F. Jennings.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

N. W. SHOWACRE has awarded the contract for heating 22 houses that he is building to F. O. Singer & Co., Baltimore, Md. They will use the Fuller & Warren Company's No 300 hot water boiler, installed according to plans prepared by J. J. Wilson.

CONTRACTS have been awarded by the Public Buildings Commission, at Philadelphia, to McCambridge & Co. and Claridge & Bartholemew for the plumbing supplies for the ensuing year.

THE CONTRACT for heating the Commercial Club, at Richmond, Ind., has been let to Border Bros. of Columbus, Ohio.

GREEN & LOGAN, Bridgeport, Conn., have the contract for the heating and plumbing for a new house being built by Wm. Burg.

AT THE RECENT MEETING of the Norwalk (Conn.) Hospital Association it was voted that the new hospital building should cost not less than $10,000, and the executive committee was authorized to secure definite plans for the structure.

WM. F. DONNELLY, New Haven, Conn., is to erect a flat building to have a hot water heating plant and a plumbing system.

THE NEW HAVEN HEATING AND PLUMBING COMPANY, New Haven, Conn., have taken the contract for heating the new Winchester Building. A Bigelow boiler and the H. B. Smith Company's Royal Union radiators will be used. They also have the contract for placing two Rapid heaters in Theo. R. Blakeslee's new house.

BOTSFORD & ENGLISH, New Haven, Conn., have the contract for the plumbing in the residence building for J. D. Hildreth, and for the residence of Mrs. Ives.

S. J. FREEMAN, Hartford, Conn., will expend $13,000 in remodeling his building, and among the improvements will be a hot water heating plant and a plumbing system.

CLARKSON, SCOTT & Co., Philadelphia, Pa., have been awarded the contract for furnishing an extensive heating plant for the Presbyterian Home for Widows and Single Women at Fifty-eighth street and Woodland avenue.

THOMAS BRADFORD, Danielsonville, Conn., has the contract to put in the steam radiators for Phœnix Hall. There will be six in number, making 600 feet of heating surface in all.

THEODORE PERKINS & Co., Canandaigua, N. Y., have been awarded the contract for putting the steam heating apparatus in the new county jail.

JAMES AHERN, Hartford, Conn., is erecting three houses of two flats each in his city, and it is needless to say that a plumber will have to bid low to get the plumbing contract.

B. D. DUGGAN, 207–209 Lake street, Chicago, will put two No. 621 Richmond furnaces in the flat building of Joseph Leclere, 62 Sawyer avenue, and one No. 210 Richmond furnace in the building of E. Besenthal, Leavitt and Division streets.

THE EXETER MACHINE WORKS, 32 Oliver street, Boston, Mass., are furnishing two large Exeter steam boilers and a carload of Exeter radiators for the block at Hudson, Mass., for which Alines & Keeler have the heating contract. They are also furnishing a large Exeter boiler and Exeter radiators for the Morse Block, Sharon, Mass.

GEORGE L. ROOD, 79 Lake street, Chicago, is to install a Royal steam heater in the flat building of Garner Bros., Garfield boulevard and Halsted street.

THE CHARLES H. SIMMONS COMPANY, 72–74 Market street, Chicago, have the contract for steam heating in the flat building of Lincoln Brooke, Wabash avenue and Thirty-sixth street.

SHAPLEY & WELLS, Binghamton, N. Y., have the contract for the ventilating plant for the Court House. Their bid was $1585.

THE CONTRACT for fitting the "Musgrove" Block, at Andover, Mass., for steam heat has been secured by C. S. Shepard of Lowell, Mass.

F. A. WENDELL, Salem, Mass., has been awarded the contract for plumbing the new 12-tenement house of Joseph Ladeau.

O. S. KENDALL & Co., Worcester, Mass., have been awarded the contract for furnishing the heating plants for the new farm building of the Worcester Lunatic Hospital and the new city engine house at Bloomingdale. In the first named will be set a William Allen & Son's boiler and in the second one made by the Stewart Boiler Works.

STOVE TRADE NOTES.

Ohio Stove Trade.

With one or two exceptions reports from manufacturers of stoves and ranges are discouraging. The foundries having trade with the South are especially blue; the low prices current for cotton and the freezing of the fruit in Florida are cited as among the features discouraging buying of goods by Southern dealers.

Some Northern manufacturers are still shut down, and as larger stocks than usual were carried over from last year, with no increase in the demand, such producers have nothing encouraging to offer. At the same time, while such manufacturers experience dull trade now, they certainly cherish hope for the future, as they are making preparations for opening new departments and otherwise expanding business, which would not be justified if there were not good reason for expecting an improvement during the coming season. For the present, however, while a few dealers and manufacturers are receiving liberal patronage for this time of year, the majority admit that trade is not developing as was expected after stock taking. Some producers even sound a note of warning that if wisdom is not exercised by manufacturers there is reason "to justify the belief that 1895 will be the worst year of all the poor years they have seen recently."

This state of affairs seems to be reflected in the condition of the market for pig iron, which is quiet and easy in tone, but there is some indication of more inquiry if not an increased volume of business in the near future. Money is abundant and accumulating in this section, seeking investment in local and Government securities at exceedingly high values, rather than employment in business enterprises.

The assembly of United States manufacturers in Cincinnati to consider the advisability of forming a national organization have already taken preliminary steps in the movement and at the moment of writing there seems no doubt but that the organization will be completed as was originally intended. This organization will secure united action, legislative and otherwise, for the common good of manufacturing industries throughout the country. Questions of national and international importance have been already and will be further considered and discussed. Energetic action will follow upon the interchange of views and permanent organization.

Cupola Tuyeres.*—III.

BY DR. EDWARD KIRK.

Chenney Tuyere.

The Chenney tuyere, designed by Mr. Chenney, a practical foundryman of Pittsburgh, Pa., now deceased, is a double tuyere very similar in arrangement to the Colliau & Whiting tuyeres, the only difference being that both the upper and lower rows point downward at a sharp angle to the lining.

The Double Tuyere.

The double or two rows of tuyeres appears to have first been designed and put into practical use about 1854 by Mr. Ireland, a practical English foundryman and cupola builder. In Ireland's cupolas, many of which were in use in England about that time, the tuyeres were placed in two rows about 18 inches apart. Those in the upper row were of only one-third the diameter of those in the lower row, and twice the number of tuyeres were placed in the upper row as were in the lower row. The slag hole was also used by Ireland in his cupolas, which were run for a great many hours without dumping or raking out, as was the custom in those days. These cupolas appear to have given very good results in long heats, but in short heats they were not so satisfactory, and in more recent patents obtained by Mr. Ireland the upper row of tuyeres was abandoned. The double tuyere was also used in Voisine's cupolas, another English cupola designer and constructor, and in Woodward's steam jet cupola, also an English cupola, many years before they were introduced into this country by Mr. Colliau about 1876.

It is claimed for the double tuyere that the second row consumes the gases which escape with the single tuyere, and, therefore, a great saving in fuel is effected in melting. That a more intense heat is created in the cupola at the melting zone by the double tuyere cannot be disputed, for the destruction of lining is much greater at this point than with the single tuyere; but, on the other hand, that any saving in fuel is effected has not been proven by comparative tests made in melting with the double tuyere cupola and the single tuyere cupola, when properly constructed and managed. On the contrary it has been proven that the single tuyere cupola is the most economical in fuel and lining. That the double tuyere melts iron faster than the single tuyere in cupolas of the same diameter is undisputed, and as between the single and double tuyere it is only a question whether the time saved in melting more than compensates for the extra expense of lining. When a double tuyere cupola is run to its full capacity the consumption of fuel per ton of iron is about the same as the single tuyere, but in small heats it is much greater. This is due to the large amount of fuel required for a bed, owing to the great hight of the upper tuyeres above the sand bottom, for the bed must be made about the same hight above the upper tuyeres as above the lower tuyeres in a single tuyere cupola, and no greater amount of iron can be charged on the bed with the double tuyere than with the single tuyere. When constructing or ordering a double tuyere cupola the smallest one that will do the work should be selected, so that the cupola may be run to its full capacity each heat and the best results obtained in melting.

Three Rows of Tuyeres.

A number of large cupolas have been constructed with three rows of tuyeres, for the purpose of doing faster melting than can be done with the single or double tuyere cupola. Probably one of the best melting cupolas of this kind in use at the present time is one constructed by Abendroth Bros., Port Chester, N. Y., to melt iron for stove plate, sinks, soil pipe and plumbers' fittings. This cupola is 60 inches diameter at the tuyeres and 72 inches at the charging door, and is supplied with blast from 36 tuyeres, placed in the cupola in three horizontal rows 10 inches apart, 12 tuyeres being in each row. The tuyeres in the first row are 6 inches square, those in the second row 4 inches square, and those in the third row 2 inches square. This cupola melts 60 tons of iron in four hours, which is probably the fastest melting done in this country for the same number of hours for light work requiring hot iron. In the double or triple tuyere cupola the upper tuyeres may be placed directly over a tuyere in the lower row, or they may be placed between the tuyeres of the lower row at a higher level. In Ireland's cupolas double the number of tuyeres were placed in the upper row as were in the lower row, so that one was placed directly over each tuyere in the lower row and one between. In the modern double tuyere cupola the same number of tuyeres are placed in each row, and the upper tuyeres are generally placed between those in the lower row. The object in placing these tuyeres in a cupola, as stated before, is to supply the oxygen to burn the unconsumed gases escaping from the combination of fuel at the lower tuyeres. If a proper amount of blast is admitted at the lower tuyere the cupola is filled with gases at this point, and it does not make any difference whether the upper tuyeres are placed over or between the lower ones, so long as the tuyeres are only to supply oxygen to consume the gases with which the cupola is filled. If this theory of producing heat by consuming the escaping gases from the combustion of fuel is correct, they can be consumed at any point in the cupola, and the row of tuyeres for this purpose should be placed above the bed, and the gas burned in the first charge of iron to heat it and prepare it for melting before it settles into the melting zone. To consume these gases only the tuyeres should be small, and the number of tuyeres in the upper rows should be two or three times greater than in the lower row so as to supply oxygen to all parts of the cupola, and not permit

* Copyrighted, 1894, by Edward Kirk.

the gases to escape unconsumed between the tuyeres. If the tuyeres in the second or third rows are made too large in proportion to the lower row, the supply of oxygen is too great for the combustion of the gases, and the effect is to cool the iron. In the modern double tuyere cupola this theory is not carried out, for the tuyeres in the second row are made big, and admit such a large volume of oxygen at one point that if they were placed high their effect would be to cool the iron rather than heat it. But they are placed low so as to force the blast into the bed and give a deeper melting zone, and their effect is to cause a more rapid combustion of fuel and do faster melting than is done in the single tuyere cupola of the same diameter.

Greiner Tuyere.

In Fig. 16 is seen the Greiner tuyere device. The novelty of this device consists in a judicious admission of blast into the upper zones of a cupola, whereby the combustible gases are consumed within the cupola and the heat utilized to preheat the descending charges, thereby effecting a saving in the fuel necessary to melt the iron when

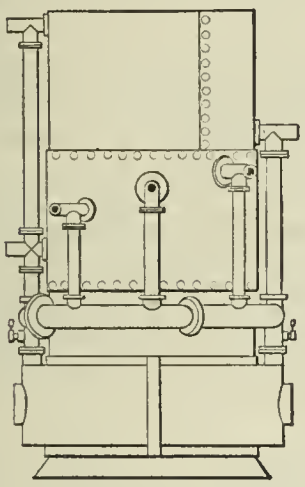

Fig. 16.—*Greiner Tuyere.*

it reaches the melting zone. This device consists of a number of upright gas pipes attached to the top of the wind box around the cupola, with branch pipes of 1 inch diameter extending into the cupola through the lining and about 1 foot apart, from a short distance above the melting zone to near the charging door. It is claimed that these small pipes admit a sufficient amount of oxygen to the cupola to burn the carbonic oxide produced by the carbonic acid formed at the tuyeres absorbing carbon from the fuel in its ascent. A great saving in fuel is thus effected by consuming this gas and preparing the iron for melting before it reaches the melting zone. A large number of cupolas with this device are in use in Europe and quite a number in this country.

Adjustable Tuyeres.

Tuyeres are sometimes placed in a cupola so they may be adjusted to conform with the size of the heat to be melted or the way the iron is to be drawn from the cupola, and thus save fuel in the bed. They are placed low when the heat is small or the iron is drawn from the cupola as fast as melted, and placed high when the heat is large or when iron is to be held in the cupola for a large piece of work. One of the best arranged cupolas of this kind I have seen is the cupola of the Pennsylvania Dismond Drill & Mfg. Company, Birdsboro, Pa. The air belt extending around the cupola is riveted to the shell about 4 feet from the bottom plate From this belt a cast iron air box bolted to the shell extends down nearly to the bottom plate in front of each tuyere. The front of this box has a sliding door extending full length of the box. The cupola shell has a slot in front of each box the full length of the box. On each side of this slot a piece of angle iron is riveted to the shell to hold the lining in place. The slot is filled in with fire brick, and a tuyere opening left at any desired hight from the bottom. When it is desired to lower the tuyere the brick are removed from the bottom of the tuyere and placed at the top, and held in place by a little stiff daubing or clay, and when it is desired to raise it the brick are removed from the top and placed at the bottom when making up the cupola. With the Colliau and Whiting style of air belt an adjustable tuyere can be arranged in this way at a very moderate cost, and foundrymen who think they must have their tuyeres placed high so they can make a large casting and only make such a casting once or twice a year, can save a great deal of fuel from the bed by having their tuyeres arranged in this way. The old plan of putting in two or three tuyere holes one above the other, and adjusting the tuyeres during the heat by raising the tuyere pipe from one to the other, is not practicable with the modern way of charging a cupola, and has long since been abandoned.

Lindemann's Folding Oven.

J. P. Lindemann & Sons of Milwaukee, Wis., have brought out a folding oven for oil, gas and vapor stoves, which possesses a number of interesting features. It is an original construction, on which they have applied for a patent. The oven is made in three solid sections, namely, the body, top and bottom, each complete in itself. These sections are entirely automatic in their action, requiring no hooks, screws, bolts or other separate parts to be used in putting the oven together. By inserting the top and bottom in their proper places, the oven is instantaneously ready for use. The body, to which is firmly attached the inside lining, is solidly and perfectly united by means of patent invisible hinges. This method of construction makes the body and linings one complete and solid section which folds in such a way that it nests solidly. Six ovens can thus be packed in a crate, making a compact package, taking a very low freight rate, and preventing damage to any parts of the oven or spoiling the ornamentation. Ovens shipped in this manner are reduced to one-fifth of the bulk of other ovens. The setting up or taking apart of an oven it so easy and simple that this feature can be made available at any time to save space, either for a dealer or consumer.

While all the qualifications for a perfect knock down or lay down oven are attained, yet none of the features of the flue arrangement of the standard Lindemann ovens have been sacrificed. The flues are constructed to distribute an evenly tempered heat into the oven, allowing the use of the upper and lower shelves at the same time. All the walls are utilized as flues, saving a large amount of heat. The bottom of the oven is supplied with a deflecting disk to prevent burning from below. The escape of the gases is in the top, so that the heat can there be utilized for warming plates, drawing tea, &c. This arrangement has been planned on scientific lines, which have been thoroughly tested by the manufacturers, and have proved very satisfactory in practical use, as shown by the steadily increasing trade which they enjoy. Six styles of folding ovens and nine styles of standard ovens are made, in both tin and Russia iron, to meet all possible requirements for portable ovens. The assortment now presented to the trade is much larger than that of last year. The firm are also large manufacturers of tinware, oil cans and sheet iron goods. They are the sole makers of Acme corrugated elbows, which are perfectly smooth on both sides.

The Troy Nickel Works

of Troy, N. Y., have just issued from the press an exceedingly attractive catalogue and price-list of Alaska stove trimmings which they manufacture in extensive variety. The volume is oblong in its general shape, profusely illustrated, neatly printed, and is bound in paper covers of rich design, stitched with a silken cord of a delicate shade of blue. The front cover is embellished with a design decidedly wintry, while the words "Troy Nickel Works, Manufacturers of Alaska Stove Trimmings, Troy, N. Y.," appear in prominent letters, but with an icy finish. The last page of the cover is embellished with a design somewhat similar in character to that on the front cover, but carrying representations of an Alaska stove lifter and poker, and the words "Always cold when in use." In the introduction we find a request to the effect that if by some unforeseen accident the catalogue falls into the hands of a person for whom it is obviously not intended, he is requested to hand it to the first hardware jobber or stove maker he meets and thereby receive the thanks of the Troy Nickel Works. The goods illustrated within the covers of this interesting volume include Alaska fire sets, shovels, stove lid lifters, pokers, kettle bail handles, tack hammers, stove knobs, turn keys, oven door handles, &c. Attention is also given to Alaska handles for drop oven doors for steel and wrought iron ranges and also to a full line of solid iron nickel plated stove trimmings, consisting of knobs, hinge pins, turn keys, foot rails, &c., on which special discounts will be made on application.

Marks on Fire Place Grates.

A correspondent writes us an interesting letter on the subject of fire place grates, in which attention is called to the fact that many makers of these goods omit to put any marks on them by which the ordering of repairs would be facilitated. He says:

There are many patterns of the most beautiful design in cast iron, but, strange to say, there are no marks on any parts of the grates by which one can identify the manufacturer in case the parts are destroyed or burned out. This is the cause of much perplexity and loss to the dealer. What are the manufacturers of grates thinking about? Suppose a stove founder should make a line of stoves and place them on the market without a name and number and omit the name of the makers, would not the dealer have a fine time furnishing repairs? That is just the situation with the grate question at the present time. A customer says: "Send a man to my house and put in a dump to my fire place grate." The workman goes to the place designated,

but finds no mark on the grate to tell him who makes it, nor is there any number on the grate. If the old dump is there we make a tracing of it and mail a copy to every manufacturer in the United States, with a view to ascertain who can furnish the necessary repair.

ODD PLATES.

THE LATEST NOVELTY of the advertising sort that the Gobeille Pattern Company, Cleveland, Ohio, are responsible for is a most deceptive imitation of a Western Union telegraph blank, and reads as follows: "Telegram received. Don't order any new patterns without writing us for drawings." Signed, "The Gobeille Pattern Company." While, as we say, the blank resembles the Western Union official blank, the printed matter on it all relates to the Gobeille Pattern Company, but it is distributed in such a way as to give the impression of the other form.

THE CO-OPERATIVE FOUNDRY COMPANY of Rochester, N. Y., have elected the following officers: Nicholas Brayer, president, and E. W. Peck, secretary and treasurer. These with John F. Brayer, S. R. Sill, Frank N. Brayer, Henry Cribben, W. F. Peck, F. J. Wahl and E. Detamble constitute the Board of Directors. The company have declared their twenty-seventh annual dividend, and have never passed one since their organization in 1867. The management has been in the same hands during this period. The treasurer's report showed a clean balance sheet, with no liabilities of any nature, and assets of nearly $500,000. After the meeting the usual festivities, which are an annual feature, were enjoyed by all present.

AT THE ANNUAL MEETING of the Superior Furnace Company, Little Falls, N. Y., the following officers for the ensuing year were elected: President, Watts Loomis; vice-president, Walter Whitman; directors, W. J. Millegan, Victor Adams, Charles Bailey, T. Dasey, W. T. Loomis and W. H. Switzer.

THE KERNAN FURNACE COMPANY of Utica, N. Y., have chosen the following officers for 1895: President, Francis Kernan; vice-president, William J. Owens; treasurer, Joseph F. Kernan; secretary, William H. Landers; directors, N. E. Kernan, Francis Kernan, Joseph F. Kernan, William H. Landers, William J. Owens and N. E. Devereux.

THE SCHUYLKILL VALLEY STOVE COMPANY of Spring City, Pa., resumed operations in all departments on Wednesday, January 23, giving employment to a large force.

AT THE ANNUAL MEETING of the stockholders of the Eclipse Stove Company, Mansfield, Ohio, the following Board of Directors were elected: J. H. Mering of Muncie, Ind.; W. A. Gorby of Marion, Ind.; H. M. Lewis, E. B. Tappen and W. J. Tappen. The Board of Directors then elected J. M. Mering president, W. A. Gorby vice-president, W. J. Tappen secretary and treasurer, Allen Blanchard superintendent and H. M. Lewis foreman of the foundry.

SAMUEL N. REEVES of the late firm of Reeves & Horner, Philadelphia, and George E. P. Smiley, who on November last commenced business as manufacturers' agents, under the firm name of Reeves & Smiley, have leased the premises 129 North Second street, Philadelphia, and will occupy them on or about February 1, representing the following manufacturers: Plymouth Foundry Company, ranges, boat stoves, oil stoves and heaters; Wisconsin Refrigerator Company. Peerless and Zenith refrigerators; Western Stove & Mfg. Company, gasoline stoves; Jas. R. Wotherspoon, Reeves Globe ovens for gasoline, gas and oil stoves, and Silver & Co., gas stoves, oil heaters, &c. They will carry a good stock in the lines they represent, in order to facilitate prompt shipment of orders.

IN REFERENCE to the calendar recently sent out by the Scranton Stove Works of Scranton, Pa., mention was made of a picture of three boys employed at a coal breaker shown in the background of the picture which embellished the card. A great many inquiries have been received by the company asking for an explanation of the picture, and they have replied to the effect that the photograph of the boys was taken just after they had left their work and as they were on their way home. The title given to the picture by the man who produced the engraving was "See 'em run." The boy in the center of the picture is a mule driver, who takes the coal by means of mule and mine car from the miner to the foot of the plane, where it is hoisted to the top of the breaker. The boy at the left is the one who opens and closes the door that distributes the air through the various chambers as the coal is taken out and the empty cars are received back into the chambers. This boy also looks after the switches. The boy on the right in the picture is a slate breaker, who sits at the chute and throws out the slate as the coal passes through the screens down into the cars.

WILLIAM P. WEATHERBY, a well-known and highly respected resident of New Castle, Pa., died recently in the eighty-second year of his age, having been a resident of that place for nearly 60 years. He learned his trade as a stove molder in the foundry of Hugh White, in Cincinnati, going from there to Pittsburgh, then in turn to Beaver, and thence to New Castle, Pa. He was employed as a boss molder in Cunningham's Stove Foundry at New Castle, Pa., for some 40 years. A local paper refers to him as an honest, upright man, beloved by all who knew him and a man who will be missed by a large circle of surving relatives and friends.

ARTICLES OF INCORPORATION were filed on the 11th inst. at Omaha, Neb., by the Cole Mfg. Company, with a capital stock of $100,000. The organization is for the purpose of carrying on the manufacture and sale of stoves and hardware specialties. A majority of the capital stock is to be held by H. A. Cole and E. C. Cole in consideration of the transfer by them to the company of all the machinery, patterns, &c., connected with their factory in the city named. The Board of Directors for the first year is composed of H. A. Cole, E. C. Cole and Arthur T. Cole.

EUGENE MUNSELL & Co. of 218 Water street, New York, will be represented during the year 1895 by the following salesmen, who will cover the territory named: George W. Graves will superintend the manufacture of the company's goods and at intervals visit the building trades in the Metropolis and adjacent cities, C. W. Yasinski and E. S. Coyne will look after the retail trade in New York City, Brooklyn, Jersey City and Newark; Charles E. Coleman will cover New York, Massachusetts and Western Connecticut, and William W. Swan will cover New Jersey, Connecticut and Long Island. The above mentioned salesmen are now visiting the trade in their respective sections.

BRIDGEFORD & Co. of Louisville, Ky., have just about completed new warehouses to replace those destroyed by fire in the latter part of 1893. With the additional machinery which the company have introduced, they expect to be in a far better position for promptly meeting the demand of their extensive trade than at any previous time in their history.

S. CHENEY & SON of Manlius, N. Y., have improved their facilities for fighting fire by putting in a number of additional hydrants.

THE GEORGIA STOVE WORKS of Atlanta, Ga., have about ready for the market a six hole range adapted for using coal and wood, and also a new wood and coal cook stove. These goods are very attractive in appearance, being substantially mounted and embodying the modern improvements. The makers expect for them a large and gratifying demand.

THE SYRACUSE STOVE WORKS of Syracuse, N. Y., have brought out a new single oven range for the season of 1895, it being offered in both portable and brick set form. The company have lately installed a sprinkler system throughout their plant, putting in a 500-gallon fire pump, and thereby securing a lower rate of insurance.

THE BLOOMINGTON STOVE COMPANY of Bloomington, Ill., are getting out a new line of 16 sizes and styles of cook stoves and ranges, and constructing a novelty in the shape of an all cast steel range, which is being offered in 18 styles and sizes. The makers feel that this steel range will prove very popular with the trade and meet with a large demand.

THE BRAND STOVE COMPANY of Milwaukee, Wis., are adding to their already extensive assortment of stoves and heaters a new line of cooks and ranges and a new line of furnaces.

CREA, GRAHAM & Co. of 155 Rebecca street, Allegheny, Pa., are bringing out a new line of natural gas ranges and gas heaters, embodying the latest improvements. They have improved and refitted a line of parlor stoves and added two sizes of a cottage parlor to their assortment.

THE CLEVELAND CO-OPERATIVE STOVE COMPANY of Cleveland, Ohio, are offering the trade this year three sizes of new heating stoves and intimate that they have under way a construction that will prove a decided surprise.

L. J. MUELLER FURNACE COMPANY, Milwaukee, Wis., are getting out the patterns for a line of furnaces which can be sold at a low price, and also propose to bring out a new soft coal heater.

THE NEW RANGE which the B. C. Bibb Stove Company of Baltimore, Md., have brought out under the name Tuxedo is made with right and left hand fire box and large oven. It is offered the trade in both portable form and brick set and embodies the latest improvements.

THE HOFFMAN RUSSELL COMPANY, 82 Lake street, Chicago, having discontinued contracting in the city. W. A. Bowron will assume this branch of the business and act as city sales agent for the Triumph furnaces.

THE FERROSTEEL COMPANY of 63 and 64 Wade Building, Cleveland,

Ohio, are about placing on the market some new sizes of their Ferrosteel ranges, which were very popular last year. The company report that their line of Ferrosteel registers is being well received at the hands of the trade.

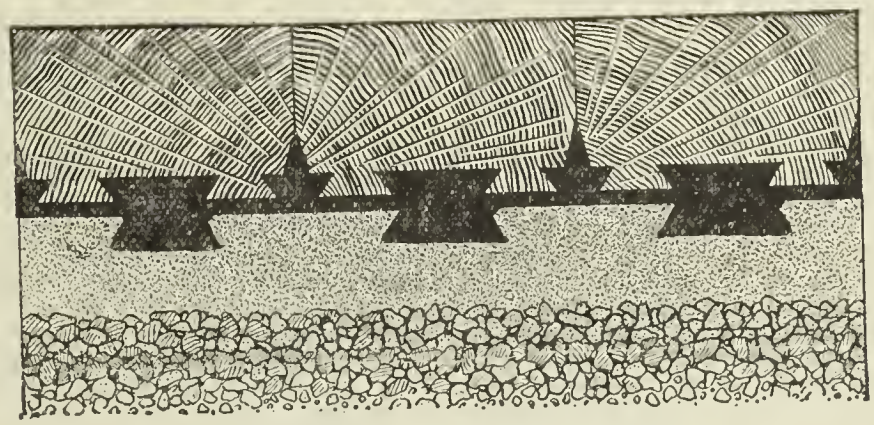
SAM S. UTTER, 113 Beekman street, New York, received during the past week a number of gratifying orders from his agents in the West. We are advised that the sales of oil stoves thus far in the month of January were in excess of those of December or for the corresponding period of many previous years.

H. WATERMAN, 107 Beekman street, manager of the New York branch of the Cleveland Foundry Company, has recovered from an attack of the grip, which kept him from his desk for several days. We understand that the company which he represents have lately shipped to Japan and Corea a large order for oil stoves.

IN *The Metal Worker* January 19, in referring to two of the representatives of the Michigan Stove Company, the names were erroneously given through the changing of a letter. Their representative who will continue to visit the trade in New York and Pennsylvania is Frank P. McCanna and their representative in Southern Michigan is A. H. Dane.

HART & CROUSE of Utica, N. Y., have issued an exceedingly attractive catalogue of hot air furnaces for the season of 1895. The printing is upon good paper and the binding in paper covers of a delicate shade of pink, with side title consisting of the name and address of the company and an indication of the line of goods manufactured embossed in script letters. The opening pages are devoted to a chapter on furnace heating, in which mention is made of the company's Royal, Prince Royal, Victor and Imperial heaters, after which are presented illustrations of those goods, together with brief descriptive letterpress covering the styles, sizes and prices. Directions are given for setting brick set and portable furnaces, and numerous tables show the capacity of pipes, registers, &c.

AT THE ANNUAL MEETING of the Auburn Stove Foundry Company, held at Auburn, Maine, on the afternoon of Thursday, January 10, the following directors were elected: H. W. Hutchins, A. L. Goss, H. Fairfield, Dr. E. S. Coan, S. Record, George M. Briggs and George W. McFadden. After the meeting of the stockholders a directors' meeting was held at which the treasurer's report for the past year was examined and approved. The directors elected H. Wesley Hutchins president and T. H. Roberts treasurer for the ensuing year. It was decided to do away with the office of clerk, and hereafter the duties will be performed by the last named official.



THE STOVE FOUNDRY of Floyd, Wells & Co., at Royersford, Pa., resumed operations on Wednesday of this week.

THE BUCKWALTER STOVE COMPANY'S foundry, Royersford, Pa., started up January 23 and will run three days a week.

THE MICHIGAN STOVE COMPANY, Detroit, Mich., have lately issued an interesting announcement relative to the scheme of advertising stoves and ranges by giving practical demonstrations of their merits in the shape of what they designate as "cooking carnivals." In connection with the announcement is a copy of a half page advertisement inserted in a local paper by the Lowell Hardware Company of Janesville, Wis., which is said to have produced results that warranted them in ordering from the company a full carload of Columbian-Garland steel ranges. This, the company state, goes to show the result of judicious advertising, and they trust their customers will profit by using the columns of local papers, always employing the Garland trade-mark, any size cut of which the company will furnish dealers free of charge. At the store of the Lowell Hardware Company a range was in full operation every afternoon and evening, at which time a free lunch of hot biscuits and coffee was served.

Wood-Block Flooring.

A form of flooring which after many years of trial has become popular in the chief countries of Europe has lately been introduced into the United States by James G. Wilson, well known manufacturer of rolling partitions, rolling steel shutters, Venetian blinds, &c., No. 74 West Twenty-third street, New York City. This flooring consists of wooden blocks about 18 inches long and from 2½ to 3 inches wide, varying in thickness from 1 to 1½ inches. The blocks are made from carefully selected lumber and are molded and cut by machinery designed especially for the purpose, thus insuring, when laid, a perfect fit and accurate joints. The block flooring is laid upon a cement foundation and secured to it by means of a bituminous compound which not only serves as a damp and vermin proof course, but also as a double dovetail key, binding the wood floor and the concrete foundation into a solid, immovable structure. The foundation for the floor may be of any fire proof material, such as brick, terra cotta tiles or coarse concrete. When this is dry, and a few days before the wood floor is to be laid, the top or finishing layer of Portland cement concrete, ranging from ¾-inch to 1½ inches in thickness, is floated on and brought to a dead level. While this is still plastic a multiple plow is run over the surface, cutting out parallel dovetail channels, which form an anchorage for the blocks. The surface thus prepared is permitted to dry, and when hard a hot bituminous compound is poured on, entering and filling the channels in the concrete and overflowing the surface to the required thickness. Into this hot compound the wood blocks are then pressed in such a way that every one is firmly anchored to its foundation. The illustration which is presented represents a section through the floor, showing first a course of rough concrete, then the cement upon which is the bituminous compound, and upon this in turn the wooden blocks of the flooring. This form of flooring is referred to by Mr. Wilson as being noiseless and warm, indestructible and impervious to dry rot, vermin, dirt, dampness and drafts. It is especially adapted for public and private buildings, and constitutes what is designated as an "ideal floor." The wooden blocks may be arranged in different ways, giving patterns of pleasing variety. Samples and estimates can be obtained on application to Mr. Wilson, at the address given.

Section through Wood-Block Flooring.

ARTICLES OF INCORPORATION have just been filed of the Jeffersonville Corrugating & Roofing Company. The capital stock is $10,000. President, P. C. Donovan; vice president, Thomas Fanning; secretary and treasurer, R. M. Martin. The latter, who for years has been manager of the Patton Mfg. Company, will have general charge of the corrugating works. His experience is large and the new company are assured of the best management. This company will manufacture all kinds of iron and steel roofing, but will pay most attention to corrugated and V-crimped roofing.

In spite of the depressed condition of business in 1894 the number of new textile mills established in the United States was very large, especially during the latter half of the year. The *American Wool and Cotton Reporter* places the number of new plants erected at 263, the Southern States making a particularly good showing. The record by States for the year is as follows: New York, 38; Pennsylvania, 36; North Carolina, 26; South Carolina, 23; Georgia, 19; Massachusetts, 15; Maine, 11; Virginia and Rhode Island, 8 each; Texas and Connecticut, 7 each, the remainder being divided among the other States.

An important development of the present gold exporting movement from New York was made public last week, namely, the purchase of large quantities of refined gold bars for export by foreign banking houses in place of gold coin. Receipts of refined gold at the United States assay office in Wall street have fallen off nine-tenths in volume in consequence of the metal having been purchased from the agents of the Western refineries by exporters, who are content to pay a premium of $1 for every $1000 in gold bars rather than ship gold coin, which is subject to loss by abrasion.

The steamer "Australia," which sailed from the port of San Francisco for Australia on Monday, carried as part of her cargo 2000 stands of arms and 75,000 rounds of ammunition for the Hawaiian Government.

TRADE REPORT.

The Iron Market.

Pig Iron.—Transactions on a large scale have been extremely few in the New York market. The same may be said of inquiries for round lots. There is, however, a very fair business in lots of moderate size, chiefly for prompt and near future delivery. In prices no changes of importance have taken place, but the market shows the same easy tone that has prevailed for some time past. We quote $12 @ $12.50 for No. 1; $11 @ $12 for No. 2, and $10.50 @ $11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at $11.25 @ $11.50 for No. 1; $10.25 @ $11 for No. 2; $10 @ $10.50 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.50 @ $10.

Dull and heavy is about all that can be said in regard to the Philadelphia Pig Iron market. There is plenty of metal at the old prices, but as buyers are scarce and extremely cautious, it is difficult to place round lots without conceding something in their favor. It is one of the markets that cannot be quoted with exactness, as one may accept a price that another would hardly take into consideration, and, *per contra*, still another whose requirements are very stringent might pay a price that another would consider entirely too high. Then again there is the question of quantity, nearness of point of delivery, terms of payment and matters which easily make 50¢ @ 75¢ ℔ ton difference in a quotation without affecting actual values. Making all allowances for matters of this kind, however, the fact still remains that good buyers can do better than they could a month ago, due to fuller supplies and a greater pressure to secure orders. Holders claim that nothing could be had at less than our inside quotations, but as bids are not made for any but small or medium sized lots, it remains for the future to determine whether current quotations will be broken or not. Philadelphia and nearby deliveries are quoted as follows, and for some brands 20¢ @ 30¢ less at such points as Harrisburg, York, Baltimore, &c.:

Standard No. 1 Foundry X	$12.00 to $12.50
Standard No. 2 Foundry X	11.00 to 11.50
No. 2 Plain	10.75 to 11.00
No. 1 Soft	11.50 to 11.75
No. 2 Soft	10.75 to 11.00

The volume of business in the Chicago market has been somewhat better than that of the previous week, and yet trade was not particularly active. The largest contract reported was for 1000 tons of local Iron, and several others were for lots ranging from 200 to 500 tons. Some little business was done in Southern Iron, but Lake Superior Charcoal continued very quiet. Prices are firm on local Iron, but Southern appears to be inclined to weakness, evidently owing to the accumulation of stocks on furnace banks. Quotations are as follows, for cash:

Lake Superior Chareoal	$13.00 to $14.00
Loeal Coke Foundry, No. 1	10.25 to 10.50
Local Coke Foundry, No. 2	9.75 to 10.00
Loeal Coke Foundry, No. 3	9.50 to 9.75
Loeal Seoteh	10.50 to 11.00
Ohio Strong Softeners, No. 1	12.50 to 13.00
Southern Silvery, No. 1	11.50 to 11.75
Southern Silvery, No. 2	11.25 to 11.50
Southern Coke, No. 2	10.00 to 10.50
Southern Coke, No. 3	9.75 to 10.25
Southern, No. 1, Soft	10.00 to 10.50
Southern, No. 2, Soft	9.75 to 10.25
Alabama Car Wheel	17.50 to 18.00
Jaekson County Silvery	15.50 to 16.00
Other Ohio Silvery	14.25 to 14.50

Sales of Pig Iron in the Pittsburgh district have been small, and there is not much pressure on the part of furnaces to dispose of their product. The feeling prevails that Iron will bring better prices in the second quarter of the year, and the probability of slightly higher prices for Ore is having its effect. Quotations are given as follows:

No. 1 Foundry	$10.50 to $10.65, cash
No. 2 Foundry	10.00 to 10.25 "

Although no new phases have been developed in the local Iron situation at Cincinnati during the past week it is evident that a more hopeful tone prevails, if not an improved volume of business. Notwithstanding it is reported that Iron is accumulating in both North and South, the surplus is not sufficiently great to cause large producers to weaken; even smaller stacks are feeling more independent, although they are still disposed to accept an order of a desirable character even if it is necessary to shade the prices made by larger furnaces. Pipe works, which a short time since were melting heavily even to the extent of running double turns, are less busy now, but this is the usual experience at this season, while there is good reason to anticipate large purchases during the spring and summer months. Local commission men have experienced a fair sum of small orders during the week and at the close several large orders of moment are pending. Quotations are given as follows:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.00 to 9.25
Southern Coke, No. 3	8.50 to 8.75
Ohio Soft Stone Coal, No. 1	14.50 to 15.00
Ohio Soft Stone Coal, No. 2	14.00 to 14.50
Lake Superior Coke, No. 1	11.75 to 12.25
Lake Superior Coke, No. 2	10.75 to 11.50
Hanging Roek Chareoal, No. 1	16.00 to 16.50
Hanging Rock Chareoal, No. 2	15.50 to 16.00
Tennessee Chareoal, No. 1	13.00 to 13.50
Tennessee Charcoal, No. 2	12.00 to 12.50
Bessemer	11.65 to 12.00
Standard Southern Car Wheel	15.75 to 16.75
Lake Superior Car Wheel and Malleable	14.25 to 14.75

As regards the St. Louis Pig Iron market there is no improvement to note in the demand, although prices seem just a trifle more steady. There is still some low priced Iron being offered, but the major part of this Iron is either not up to the standard or else is made by a furnace whose reputation for quality is not the highest. Legitimate brands command the following prices: No. 1, Foundry, $10.25 @ $10 50; No. 2 Foundry, $9.75 @ $10. A few sales of No. 2 Foundry are reported, none of which will run over 400 tons. Aside from this the market is quiet but not weak. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.25 to $10.50
Southern Coke, No. 2 Foundry	9.75 to 10.00
Southern Coke, No 3 Foundry	9.25 to 9.50
Southern Car Wheel	16.25 to 16.75

Metal Market.

Pig Tin.—The reaction in prices mentioned last week was carried forward in the earlier days of this week, bringing wholesale prices up with a rush nearly ¼¢. Simultaneous with this rise was a sharp upward movement in London, and the deal had every appearance of having been engineered to squeeze operators who were short on January contracts, among whom were some of the bear leaders. After this squeeze, and a sudden falling off of buying orders, prices dropped almost as rapidly as they had previously advanced, and the market weakened. On Thursday, however, a further advance of nearly ¼¢ was recorded, and the market closed strong. A very fair jobbing business has been carried out, and quite a considerable amount of Tin has changed hands. Prices for small lots of Straits from store rule at about 15¢ ℔ lb.

Copper.—Dealings have been mostly of routine type, but to all accounts these involved a fairly liberal quantity of metal, chiefly for delivery during the next 30 days. Between the new business and consignments to Europe enough stock has been disposed of to give the market distinctly firm tone, and outside lots at a shade under the market that were about not long ago seem to have disappeared, for the time being at least. The smaller retail business doing is moderate in character, and prices for small parcels are unchanged at last week's quotations—namely, 15¢ ℔ lb.

Sheet Copper—Dealers report a fair run of orders and good inquiry for Cornice Copper, although the volume of actual business done is behind the average in amount. Improvement is, however, looked for as the year progresses, and a good business is anticipated by the spring.

Pig Lead.—Little change has taken place during the week. Demand keeps up well and the market retains very firm tone. The general situation is regarded as strong, and consumptive requirements, it is calculated, will keep the market so for some time to come. No change has been made in the ruling rates for small lots of American Pig from store, for which 3⅜¢ @ 3½¢ is quoted.

Spelter.—A slow market, with very flat undertone, is about all that there is to report. The buying has not improved in any particular, and the demand has been perfunctory in the extreme. In prices there is no change to note, although the market shows rather weak tone. Western in small quantities is quoted at 4¢ @ 4¼¢, according to brand. Fancy brands fetch the usual premium.

Antimony.—Dealings are of about the same volume and nature as for some time past. Prices in small lots do not vary much, remaining at about 8¢ for Hallett's and 9¼¢ for Cookson's.

Nickel.—The market is quiet, with prices at 35¢ @ 40¢, according to size of order.

Tin Plate.—Prices that proved attractive and continued reports of re-

duced production in Wales led to quite a good business in Plates for future delivery early in the week. Later the demand appeared to fall away again and relapsed into dullness. Small spot business has partaken of the general character that has marked it for some weeks past. In the aggregate, despite low prices, it has been considerably below the average of the season. The tame condition of the market in general has proved a considerable disappointment to those who looked for a revival in the demand for Plates this month. The market shows rather a soft tone, although prices remain nominally at the same level as last week.

A special London cable dispatch of January 23 to *The Iron Age* reports as follows in regard to the British Tin Plate market: In the Tin Plate market dullness is accentuated owing to weaker advices from New York and reports of restarting American mills. There is very little demand. Ordinary Bessemer Cokes sold at 9/3. Operators waiting. Many makers are refusing orders at current rates, preferring to shut down. Prices f.o.b. Wales are:

Bessemer Cokes, IC 14 x 20	@ 9/3
Siemens Cokes, IC 14 x 20	9/6 @ 9/9
Ternes, 20 x 28	18/6 @ 21/
Charcoals, IC 14 x 20	10/6 @ 12/6

Sheet Iron.—The general demand for Black Sheets continues only fair, and some of the mills are reported to be actively canvassing for orders. Galvanized sheets are in somewhat better demand than Black Sheets. Jobbers' quotations for small lots of No. 27 Common Iron from store are about 2 65¢; and Galvanized rules at 75 and 5 % @ 75 and 10 % off.

Chicago Report.

Scrap.—Trade is very light. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$6.50	....
Machinery Cast	5.50	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	7.50	....
Copper Bottoms	....	6 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	6 ¢
Light Brass	....	3 ¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2¼¢
Rubber	....	4 ¢

Anthracite.—Business is extremely dull and prices are weak. Carload lots of 12 net tons or over are quoted as follows:

	Egg, Grate.	Sto. and Ch.
Chicago, Ill	$4.75	$5.00
Milwaukee, Wis	4.75	5.00
Kansas City, Mo	7.95	8.20
Council Bluffs, Iowa	7.95	8.20
Lincoln, Neb	8.10	8.35
Sioux City, Iowa	7.95	8.20
Aberdeen, S. Dak	8.00	8.25
Dubuque, Iowa	6.05	6.30
Madison, Wis	6.25	6.50
St. Paul, Minn	7.25	7.50
Burlington, Iowa	6.25	6.50
Des Moines, Iowa	7.75	7.95
Davenport, Iowa	6.05	6.30
St. Joseph, Mo	7.95	8.20
Leavenworth, Kan	7.95	8.20
Omaha, Neb	7.95	8.20

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

CONDITION OF THE

Hardware Trade.

THE PAST WEEK has witnessed about the increase in the volume of business which is to be expected at this time. Travelers are beginning to be heard from and generally report prospects of a gradual improvement in trade. The tone of the market is unchanged and several lines of goods continue low and somewhat irregular in price, the tone of the market being rather weak and unsettled. The trade are purchasing in moderate quantities and buyers are watching the market closely to see the first indications of a reaction from the unprofitable prices at which many goods are selling. There is comparatively little complaint in regard to collections and the trade generally appear to be in good financial condition.

Advices from Chicago.—Jobbers of Shelf Hardware report that, while the business of the past week was only fair, orders the early part of the present week showed a marked improvement in number and size. The year has started out in very much better shape in every way than 1894. A peculiarity of the present trade is that the demand is running largely to miscellaneous goods. Excellent orders are being entered for spring goods to be shipped by the first of March, and all kinds of novelties in the house furnishing lines are moving freely; mechanics' tools are also in much better request than at any time last year, but in the matter of staple goods business is comparatively slow. This is ascribed, first, to the weakness recently developed in these lines, so that buyers are not yet assured that actual bottom has been reached, and, second, to the fact that the manufacturers are more largely than ever selling directly to the trade. Business in mixed carloads of Barb Wire and Wire Nails from factory is larger than usual. Another feature of the present trade is that buyers of Tinware and House Furnishing Goods, as well as general Hardware, are urging very prompt shipments, showing that stocks are light and that consumers are buying much more freely than for some time past. The outlook is regarded as very encouraging from the standpoint of Hardware jobbers.

Notes on Prices.

Wire Nails.—The volume of business during the past week has not been specially heavy, but the manufacturers report a good many inquiries, and some orders have been placed. The tone of the market is unchanged. Small lots from store in New York are quoted regularly at $1.15.

Advices from Chicago.—The movement of factory lots is reported by manufacturers as quite discouraging. They have had a lighter demand from the jobbing trade, which is evidently caused by the unsettlement of prices as reported last week. Jobbers themselves are experiencing quite a light demand. The quotation is now $1.05 for small quantities for direct shipment from factory, or $1.10 for shipment from stock in Chicago.

Cut Nails.—The condition of the Cut Nail market is not unlike that of Wire Nails. Prices are unchanged, small lots from store, New York, being quoted at 90 to 95 cents.

Advices from Chicago.—Manufacturers have had a quiet week. Orders have been light, but prices are unchanged, rates being still quoted $1 on small lots from stock.

Barb Wire.—The volume of business is not especially heavy and prices are unchanged. They are represented by the quotation of $1.85 for carload lots of Four-Point Galvanized at mill, but on large lots this figure is shaded and $1.80 given in some cases.

Advices from Chicago.—The factories in this vicinity are now all busy turning out stock for spring shipment. Business is quite good in the shipment of small lots from factory to the retail trade. Jobbers' quotations are $1.55 to $1.60, f.o.b. cars Joliet, for carloads of Painted and $1.90 to $1.95 for Galvanized, and $1.80 and $2.05, respectively, for small lots to be shipped from stock in Chicago.

Lanterns.—The following are the prices on the Tubular Mill and Crystal Lanterns described in our issues January 12 and 19, as put on the market by R. E. Dietz Company, 60 Laight street, New York.

	Per doz.
Tubular Mill Lanterns	$12.00
Crystal Lanterns	6.00

Eave Trough.—As noted last week, the list prices on Eave Trough were changed at a meeting of the United States Eave Trough and Conductor Pipe Association, held at Cincinnati, Ohio, on January 9. The full revised list, which will go into effect on February 1, 1895, is as follows:

No. 28 Gauge Galvanized Trough, Lap Joint.

	Per foot.
3 inch size, 6-inch girt	$0.13
3½ " 7 "	.14

Old Metals.—There is a fair inquiry, but only moderate business as yet, most of which is at about the prices that have ruled for several weeks. The following quotations represent the current rates paid by dealers in this city:

Heavy Copper	℔ 7 ¢
Light and Tinned Copper	℔ 6½¢
Heavy Brass	℔ 4¾¢
Light Brass	℔ 3¾¢
Lead	℔ 2¾¢
Tea Lead	℔ 2½¢
Zinc	℔ 2⅛¢
No. 1 Pewter	℔ 10 ¢
No. 2 Pewter	℔ 5½¢
Wrought Scrap Iron, ℔ gross ton	$7.50 @ $8.00
Heavy Cast Scrap, ℔ gross ton	7.50 @ 8.50
Stove Plate Scrap, ℔ gross ton	5.00
Burnt Iron, ℔ gross ton	3.00

Old Rags, Paper, &c.—Demand is fair and dealers' purchasing prices substantially the same as those quoted last week, namely:

No. 1 White Rags	℔ 3 @ 3¼¢
No. 2 White Rags	℔ 2¼ @ 2½¢
Mixed Rags	℔ ¾ @ 1 ¢
Blues and 3ds	℔ 1⅛ @ 1⅜¢
Hard Sized White Shavings	℔ 2⅛ @ 2¼¢
No. 1 White Book Shavings	℔ 1¾ @ 2⅛¢
No. 2 White Book Shavings	℔ 1 @ 1⅜¢
Light Book Shavings	℔ ⅝¢
No. 1 Mixed Shavings	℔ ⅞ @ 1 ¢
No. 2 Mixed Shavings	℔ ⅝ @ ¾¢
No. 1 Printed Books	℔ 1 @ 1¼¢
Ordinary Mixed Books	℔ ½ @ ¾¢
Newspapers	℔ 2·5¢
No. 1 Manila Paper	℔ ¾ @ 1 ¢
No 2 Manila Paper	℔ ⅝ @ ¾¢
Bogus Paper	℔ 1½¢
Common Paper	℔ ¼ @ 3·5¢
Straw Chips	℔ ⅜¢
Binders' Clippings	℔ 1½¢
Jute Butts	℔ 1½ @ 1¾¢
No. 1 Jute Bagging	℔ 1 @ 1¼¢
Mixed Bagging	℔ ¾ @ 1 ¢
No. 2 Bagging	℔ ½ @ ¾¢
Hemp Twine	℔ 2 @ 2¼¢
Manila Rope	℔ 2 @ 2¼¢
Jute Rope	℔ 1½ @ 1¾¢
Mixed Rope	℔ ¾ @ ⅞¢

Old Rubber.—The following quotations represent about the prices paid by dealers, New York delivery:

Car Springs, ton lots, ℔	$0.03¾ @ .04
Rubber Shoes, carloads, delivered at factory, ℔	@ .05¼
Rubber Shoes, less than carloads, ℔	@ .04¾
White Wringer Rolls, ℔	@ .03⅞
White Syringes, ℔	@ .03⅞

Trade Notes.

THE WEXLER METAL GOODS MFG. COMPANY of New York City have obtained letters of incorporation, with capital of $10,000 Directors, Judah Moses, J. Harris Balston, Arthur S. Ronald of Brooklyn and E. F. Kroyer of New York City.

THE LINDNER & REMIG MFG. COMPANY of New York have been chartered to manufacture machines wherewith to manufacture gas, electric, water, steam and other fittings and fixtures; capital, $100,000, and directors, Ernst Lindner of New York, Theo. H. Mulch of Mount Vernon and Philip W. Remig of Brooklyn.

THE CLONBROCK STEAM BOILER COMPANY were incorporated at Albany, N. Y., on January 17, to manufacture steam boilers and steam generators, steam fittings, smoke pipes, tanks, &c., in Brooklyn. The capital of the company is placed at $200,000, and the directors are Thomas F. Morrin of Jersey City, Thomas J. Lawler and John Harlin of New York City and M. B. Morrin of Brooklyn.

THE F. H. LAWSON COMPANY, Cincinnati, Ohio, Tin Plate and Metal dealers and manufacturers of Tinware and specialties, have made a large number of extensive improvements in the way of new machinery and modern appliances in the factory purchased by them from the late firm of Geo. D. Winchell Mfg. Company. They are now in possession of much better facilities for turning out goods in large quantities.

HAMILTON'S BEST REDIPPED AMERICAN ROOFING TIN, manufactured by John Hamilton, Pittsburgh, Pa., is being used on the roof of the new Post Office Building at Haverhill, Mass. The above brand of Roofing Tin has been on the market for some years, and has met with a constantly increasing demand, although sold at considerably higher prices than many other brands on the market. It has been used in roofing some of the largest Government buildings and school houses in the country and has given entire satisfaction wherever used.

THE NIAGARA STAMPING & TOOL COMPANY, Buffalo, N. Y., have just issued a small illustrated catalogue of some special machines and tools. The circular calls attention in the early pages to Squaring Sheals of various sorts; then come Circle Shears and Slitting Shears. The next division relates to Presses of many different kinds adapted for general and special purposes. These include heavy Power Presses and Foot Presses, and at the close reference is made to Crimpers, Seaming and Squeezing Machines. All the tools and machines are illustrated, and information is given, with price-lists and particulars of sizes and weights, &c.

CHAMPION STOVE CLAY for lining Stoves and Ranges and repairing Stove Linings is the subject of an announcement elsewhere in this issue by the Bridgeport Crucible Company, Bridgeport, Conn. Prices are quoted in bags for domestic use and in barrel lots for the trade.

It Is Reported—

California.

That George M. Cooley, Hardware merchant, of San Bernardino, has leased his store for two years to his brother, Frank L. Cooley, and Frank Keller, who have been connected with the house for the past eight years. Mr. Cooley will take a much needed rest to regain his health, and will go to Yuma until spring, spending the summer in Colorado. Frederick Cooley will open a branch store at Colton in about two months.

Colorado.

Andrus Bros., Hardware merchants, Pueblo, have removed to new and more commodious quarters.

That E. B. Bonnell of Claremont, S. D., will remove to Grand Junction, where he will continue business.

Connecticut.

That the firm of White & Porter, Stove dealers, Bristol, have been dissolved by mutual consent.

Georgia.

That in a large fire at Macon on the 18th inst. the building of the Dunlap Hardware Company was destroyed. The loss is estimated at $60,000; insurance, $25,000.

Illinois.

That Woodward & O'Brien are a new Hardware firm at Shipman.

That Houck & Holton, Colchester, have taken possession of their new Hardware store.

That W. R. Bottenfield of Sullivan, Ind., has purchased a Hardware store at Oblong.

Indiana.

That J. A. Hunter, Elwood, will remove his Hardware business to a new building about February 1.

That Samuel Sims of Russiaville is contemplating entering the Hardware business at Forest.

Iowa.

That Benjamin Weber is about to start in the Hardware business at Dubuque.

That Mr. Dillin has retired from the Hardware firm of Wheeler & Dillin, Nola. The business will hereafter be conducted under the style of Wheeler Bros.

That W. J. Gustin is successor to A. Long in the Hardware business at Knowlton.

Kansas.

That as J. J. Van Wick started to close his Hardware Store at Kansas City on the night of the 15th inst., two highwaymen leveled revolvers at him and commanded him to walk back into the store. The robbers tied him in a chair and commenced a search for money. Mr. Van Wick was compelled to open the safe, but it was empty. The highwaymen grew angry and flourished their revolvers in the face of their prisoner, and told him that he must either tell where the money was or get ready to die. Fearing that his captors would execute their threats, he opened a keg of nails and turned out $100 in cash, a lot of checks and some county scrip. After securing the money the robbers took the keys of the store and walked out of the front door and locked their prisoner in. Mr. Van Wick finally untied himself and reported the matter to the police.

Kentucky.

That the Hardware firm of Barkley & Holloway, Jessamine, have dissolved partnership. S. E. Holloway has purchased the interest of James F. Barkley. Mr. Barkley will make a trip to Mexico.

Michigan.

That the Carlton Hardware Company of Red Jacket have bought out the Hardware stock of Gilbert & Lang, Houghton, and placed Edward T. Emmons in charge.

Minnesota.

That H. B. Gray of Hastings, Iowa, has become associated with H. B. Gardner in the Hardware and Stove business at Minneapolis.

That Fenger, Wegener & Alton have succeeded Fenger, Wegener & White in the Hardware business at Alexandria.

That A. H. Pew has purchased the Hardware stock of G. S. Greer & Co. at Graceville.

That I. E. Sorlie will build a new Hardware store at Hartland.

That Carl Luhmann has sold out his Hardware stock at Howard Lake.

That Buell & Offenlock are a new partnership in the Hardware business at Kasota.

That J. P. Watson, Marshall, has taken his son John L. Watson into partnership with him in the Hardware business. The style will hereafter be J. P. Watson & Son. Mr. Watson has been 42 years in the Hardware business, 22 years of which as proprietor.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

Gentleman thoroughly familiar with retail stove, range and house furnishing goods business to assume the management of an extensive establishment in a prominent Southern city. Henry Smith, office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, Ohio. Jan. 26

A practical FURNACEMAN; one who can put up a furnace to heat and estimate on work; also a practical PLUMBER; one who can do a first-class sanitary job and estimate on same. "P.," No. 126, office of *The Metal Worker*, 96-102 Reade street, New York City. Jan. 26

RECEIVER'S SALE.

Notice is hereby given that by virtue of an order of the Howard Circuit Court in the case of John S. Connor, trustee, versus the William G. Fischer Manufacturing Company, the undersigned offers for private sale on and after the twelfth day of January, 1895, all of the real estate owned by the said plant and situated in Kokomo, Howard County, in the State of Indiana. He will also offer for sale at the same time all of the machinery, boilers, engines, tools, appliances, patterns and patents belonging to and useo in the manufacture of ranges and safes. In making said sale, he will offer to sell the real estate separately and also the machinery, tools, etc., above specified, or he will sell them as an entirety and will receive bids accordingly.
Terms, one-third cash, balance in nine and eighteen months with interest at 6%, with approved security.
G. W. LANDON, Receiver.

FACTORY AT WHITESTONE FOR SALE (30 minutes from New York), with boilers, 15 horse-power engine, machinery, tools, etc. Price, $5000; terms, $2000 cash, balance on mortgage at 6 per cent., if desired. Located on L. I. R. R. and the Sound, affording cheap water freights. Very advantageous for any light manufacturing, such as metal work, novelties, hardware, etc. Lot 50x100, facing on two thoroughfares, three-story brick building, 30x90, with boiler and engine annex building. Address "FACTORY," P. O. Box 2718, New York City.

FOR SALE.

An old established Hardware, Plumbing and Tin business in one of the best towns in California. Will invoice about $5000. Population 5000 and thickly settled surrounding country. Owner has made a small fortune in a few years and doing a good business at present. No shop-worn stock. Best of reasons for selling will be given to inquirers. Address "PACIFIC," care *The Metal Worker*, P. O. Box 521, New York City.

RECEIVER'S SALE.

W. P. HARRISON & CO., Clerk No. 12, Columbus, O.

— A MANUFACTURING FIRM which was besieged with applications for work hung a sign near the entrance of its establishment with the legend, "No Help Wanted."

One morning there appeared before the head of the house, to whom he was known, L——, a ne'er do well, who devoted his time to dreams of political glory rather than to books and accounts.

"Mr. S——, I want a job. As usual, I'm out of work. Can you give me something to do?"

Mr. S—— had formerly employed the applicant, and was compelled to discharge him, not so much for neglect as for general incapacity to knuckle down to good, solid work.

"My dear fellow, I'm very sorry; but didn't you see that sign when you came in?" said Mr. S——, very kindly.

"Yes, I saw it," L—— replied, "but you often told me I'm no help!"

L—— was employed.—*Harper's Bazar.*

— A RESPONSIVE AD.—Angry Caller: "I advertised for an electric battery yesterday."

Ad Clerk: "And did you not get it?"

Angry Clerk: "Get it! The ad overdid the business. My house was struck by lightning."—*Printers' Ink.*

Birds in Attack.

Birds display great skill and cunning in the chase, the attack and in guarding themselves from injury during the struggle for supremacy. The secretary bird is the inveterate enemy and untiring pursuer of the snake. All sorts, even the most venomous, he hunts with a zest that is at once interesting and amusing. The snake flees from his foe, who follows, watching every opportunity for a blow. When the reptile turns, the bird uses one of its wings as a shield and strikes with its foot. The snake buries his fangs in the wing, but leaves the poison in the plumage, and the bird escapes unhurt. Repeated blows from the powerful claw confuse and disable the snake, and at last it falls, to be at once dispatched by thrusts of the sharp beak into its head. The bird then tosses its victim into the air, and catching it as it falls swallows it.—*New York Ledger.*

— BEYOND DISPUTE.—The story is told that Mr. Tyler, from the time of his election to the Vice-Presidency until the death of General Harrison, kept no carriage, owing to the insufficiency of his salary. When, however, he found himself elevated to the chief magistracy of the country, the financial difficulty being removed, he determined to set up an equipage.

He bought a fine pair of horses, engaged an Irish coachman, and proceeded to look about for a vehicle to suit his taste. He heard of one which was for sale by a gentleman residing in Washington, and went to look at it.

It had been driven only a few times, and was in excellent condition, so that the President, after a careful examination, felt satisfied with it. Before finally deciding the matter he had his Hibernian coachman take a look at the carriage, and give his opinion of it.

"It's jist the thing fer your honor," reported that accomplished person.

"But," queried Mr. Tyler, whimsically, "do you think it would be altogether proper for the President of the United States to drive a second-hand carriage, Pat?"

"And why not?" asked Pat, with a shrewd twinkle in his eye. "Shure, an' beggin' your pardon, ain't it yersilf that's a second-hand President?"—*The Outlook.*

THE

NEW ERA

Wrought Steel Sink

Drawn from one plate of steel and superior to cast iron sinks in every particular, being lighter, stronger and more durable. It is well known that cast sinks break easily in shipping, storing and placing in position for use and from other causes. This sink being made of wrought steel will not break from any cause whatever, and being less porous than cast iron is comparatively odorless.

The bottom is formed tapering to the center and the outlet, giving the sink perfect drainage. The bowl and projecting thimble are stamped in one piece from the same plate, enabling the attachment of strainer and pipe more satisfactorily than is possible with cast sinks.

: : THE : :

Kilbourne & Jacobs Man'fg Co.,

Columbus, Ohio, U. S. A.

Being The Originators

of wrought steel sinks, we are in position to supply them in any style desired, at prices which we shall be pleased to quote upon application.

SECOND EDITION.

PRACTICAL HINTS —ON— JOINT WIPING,

FOR BEGINNERS IN PLUMBING,

WITH THIRTY-FIVE ILLUSTRATIONS.

43 PAGES. PAPER, 25c.

This book contains a reprint from *The Metal Worker* of two articles on the method of Joint Wiping, an operation calling for a very large degree of manual skill.

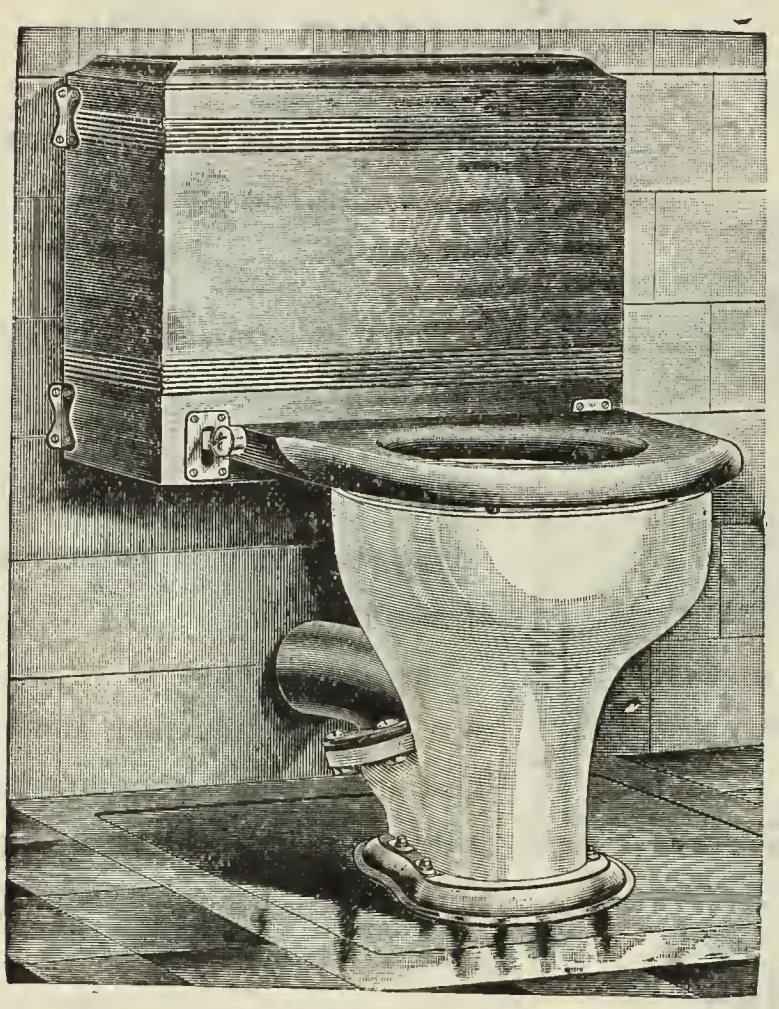
The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions.

The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners.

Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used.

The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.



DAVID WILLIAMS,

PUBLISHER,

96-102 Reade St., New York.

PURITAN WASH DOWN WATER CLOSET.

Best Closet Yet Produced for Either Public Places or Private Houses.

In presenting this Water Closet Apparatus to Architects and Plumbers and those interested in Sanitary Plumbing, will say that our aim has been to **Improve the Quality, Simplify the Construction and Reduce the Cost of Fitting in Place,** and we feel confident that we have done all this in the present Apparatus, and more too, **as it will discharge more matter, keep cleaner with less water and make less noise in the operation** than any Water Closet Apparatus now on the market.

The Closet is especially well adapted for Fire Proof Structures, as the Soil Pipe may be run above the floor, either behind or on the face of the finish. Another very good feature—stoppage can only take place in the bowl (where it can be reached from the top). Anything that passes this point will not lodge in the Soil Pipe.

These Closets are made of Vitreous Earthen Ware—that is, an absolutely non-absorbing material, warranted not to craze. Each Closet is stamped with a Bull's Head, our trade-mark.

The tank is provided with a cover finished to match. This cover deadens the noise, prevents fouling by dust and also prevents malicious persons from getting at or throwing anything into the tank.

The tank is worked either by hand action or seat action.

The distance from top of tank to finish of floor is 2 feet 6½ inches. From face of wall to front of Closet, 2 feet 1¾ inches. Depth of seal in Closet 2¾ inches.

Maule's "Skeleton" Pipe Die

Two "Points" about it—only 2 (There are plenty more, but we only mention these two here.)

1

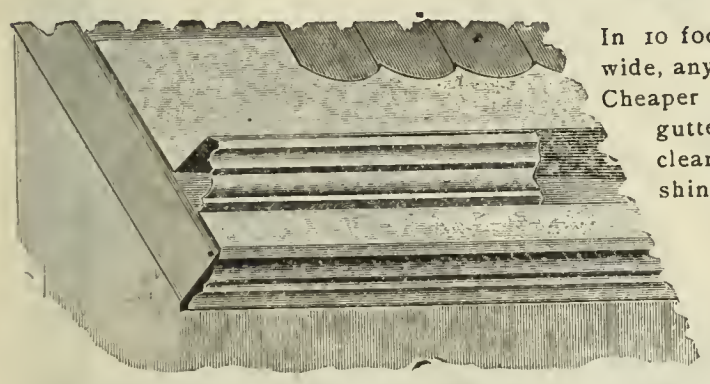
The First Cost to you of MAULE'S "SKELETON" PIPE DIE is less than that of any other Pipe-Threading Die—and

2

Before it becomes dull from use it will cut as many perfect threads as the best solid die extant, and when it is dull, you don't throw it away and buy a new one—Oh, no! You simply sharpen the cutters on a common grindstone, and so make it practically as good as it was at first, and this sharpening process may be repeated a number of times.

A sample One-inch "Skeleton" Pipe Die, either 2⅜ or 2½ x ¾ thick, by mail, postage prepaid, will cost you **62 cents,** and will be sent upon receipt of a Postal note for that amount.

DO NOT SEND US ANY POSTAGE STAMPS.



You may return such sample to us, at our expense, if, after seeing it, you do not consider it worth the price. Don't the above sound as if it might save you some money—if TRUE?

The Climax Ratchet Stock

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

Architects AND Roofers

Please Read this Proclamation.

It Relates to Our

"Pennsyl" Old Method Terne OR Roofing Plate.

Article 1st. It is **Treble Coated, Stamped** and **Squared.**

" 2d. It was introduced by us in the year 1879.

" 3d. We now sell 50 boxes where we sold one box 5 years ago; this alone is sufficient guarantee of its merits

" 4th. We **guarantee** every box of 20 x 28 to contain not less than **45 lbs.** of actual coating to 112 sheets.

" 5th. It is simply out of the question for us or **any other Manfacturer** to possibly make a better Roofing Plate.

" 6th. We ask no favoritism, only justice.

" 7th. Consult any Roofer or Tinner in your City or Town and they will give you unbiased proof of its real value.

FOUNDRY PRACTICE.

The Encyclopedia of Founding and Dictionary of Foundry Terms,

used in the practice of molding. Together with a description of the tools, mechanical appliances, materials, and methods employed to produce castings in all the useful metals and their alloys, including brass, bronze, steel, bell, iron and type founding, with many original mixtures of recognized value in the mechanic arts. Also aluminum, plating, gilding, silvering, dipping, lacquering, staining, bronzing, tinning, galvanizing, britannia-ware, German silver, nickel, soldering, brazing, ores, smelting, refining, assaying, etc. By SIMPSON BOLLAND, Author of "The Iron Founder," "The Iron Founder" Supplement. 12mo.: cloth.....**$3.00**

The Pattern Maker's Assistant

Embracing lathe work, branch work, core work, sweep work and practical gear constructions, the preparation and use of tools, together with a large collection of useful and valuable tables. Sixth edition. By JOSHUA ROSE, M. E.; illustrated with 250 engravings; 324 pages: cloth.....**$2.50**

Modern Molding and Pattern Making.

A practical treatise upon pattern shop and foundry work. By JOSEPH P. MULLIN, M.E.: 257 pages; cloth; illustrated. **$2.50**

Iron and Steel Founding.

Illustrated with 39 diagrams. By C. WYLIE. Second edition, revised and enlarged; 324 pages; 8vo; cloth... .....**$2**

The Practical Brass and Iron Founder's Guide.

A treatise on brass founding, molding, the metals and their alloys, etc. By JAMES LARKIN, late conductor of the brass foundry department in the Penn Works, Philadelphia. A new revised and greatly enlarged edition. Contents: Among the most important and entirely new sections of this edition of this valuable and popular book are the following: Behavior of Metals and Alloys in Melting and Congealing; Malleable Iron Castings; Wrought Iron or Mitis Castings; Manufacture of Steel Castings; Casting of Brass; Casting of Bronze; Bell Founding; Chill Casting; Casting without Core; Casting on to Other Metals; Casting Iron and Other Metals Upon Lace, Emoroideries, Fern Leaves and Other Combustible Materials; Some Modern Bronzes. In one volume; 12mo; 400 pages.....**$2.50**

American Foundry Practice.

Treating of loam, dry sand and green sand molding, and containing a practical treatise upon the management of cupolas and the melting of iron. By THOMAS D. WEST, practical iron molder and foundry foreman. Fully illustrated. Eighth edition, revised. 408 pages; cloth.....**$2 50**

The Iron Founder.

A comprehensive treatise on the art of molding, including chapters on core-making, loam, dry sand and green sand molding, also crystallization, shrinkage and contraction of cast iron and a full explanation of the science of pressures in molds, added to which are formulas for mixtures of iron, tables, rules and miscellaneous information. By SIMPSON BOLLAND. Illustrated with over 300 engravings. 12mo, cloth....**$2.50**

The Iron Founder Supplement.

A complete illustrated exposition of the art of casting in iron, comprising the erection and management of cupolas, reverberatory furnaces, blowers, dams, ladles, etc., mixing cast iron, founding of chilled car wheels, malleable iron castings, foundry equipments and appliances, gear molding machines, molding machines, burning, chilling, softening, annealing, pouring and feeding, foundry materials, advanced molding, measurement of castings, wrought iron, steel, etc. Also the founding of statues, the art of taking casts, pattern modeling, useful formulas and tables. By SIMPSON BOLLAND. Illustrated with over 200 engravings; 400 pages; 12mo: cloth..... ...**$2.50**

IS IT RIGHT?

Is it right to presume that the metal workers of America do not know the difference between common galvanized iron and good galvanized iron? We don't think so.

Would it be right to take advantage of that ignorance, even if it did exist? We don't think so.

Is it wise to conduct a business on that sort of a basis? We don't think so.

Taking advantage of other people's lack of expert knowledge is mighty poor business. Very few of us but have to take other people's words for things we are not wholly familiar with. Are we "fair game" for imposition because we depend on other folks' honesty? As a matter of fact, metal workers do know the difference between poor iron and good iron. They may be imposed upon once in a while because they believe in the dealer's honesty and do not watch him, but sooner or later they will find out the imposition, and then the dealer will be sure to lose their trade forever.

A dealer or manufacturer who sells inferior goods on the representation or with the understanding that they are first-class, is not a safe man to deal with. If he will sell a single sheet of iron that way, look out for him on a car load.

When we sell "Star Best Bloom," we guarantee it perfectly flat, full weight without variation, and absolutely true to gauge. It's the best grade of galvanized sheets we know how to procure. Doubtless, unscrupulous persons can occasionally sell inferior sheets at the price of the "Star." Doubtless they would make a little bigger profit on that one sale, but the big profits that result in lost trade are not so very profitable after all.

For a certainty of quality and an absolute guarantee of grades, address

MERCHANT & CO., Inc.,

PHILADELPHIA, CHICAGO, NEW YORK, BROOKLYN.

Hicks' Guide FOR Builders,

Comprising an easy, practical system of Estimating Materials and Labor for Carpenters, Contractors and Builders.

A comprehensive guide to those engaged in the various branches of the building trades.

By I. P. HICKS.

160 Pages, - 114 Illustrations.

Bound in Cloth, Price, - $1.00

This book presents to the trade, first, an easy, practical system of estimating materials, in concise form for reference. In the next place is given the average day's work of all kinds, and the average rates on which to figure in almost every detail of building construction.

Material and Labor, including Lumber, Carpentry Work Masonry, Plastering, Hardware, Painting, etc., are among the principal divisions These in turn are illustrated and ably treated under numerous sub-divisions, showing step by step the entire work of estimating, contracting and building, together with the best and most practical methods of doing the work.

This is followed by a section given to the Geometrical Measurements of Roof Surfaces, with numerous illustrations and examples. It embraces a new and simple system of framing curved roofs, also the simplest methods of roof framing of every description, with practical examples thoroughly illustrating nearly every conceivable form of roof and showing many points never before presented.

The volume also contains a chapter on Mitering Planceers, Moldings, etc., illustrating and describing how to make, in an easy, practical manner, many joints which are the source of no little trouble and annoyance on the part of the workman.

SIX SIZES OF NEW "STYLE O" INCLINABLE PRESSES, Heavy, Handsome, Durable and very Popular.

A Convenient Disease.

In the prohibition State of Kansas all the drugstores which have permits to sell intoxicating liquors are obliged by law to fill out certain printed applications stating the amount and kind of liquor purchased by each customer, and also the particular malady for which the liquor is bought. In many cities the drugstores have taken advantage of their permits to sell to the public for drinking purposes, practically turning the stores into saloons.

A recent temperance crusade has resulted in the conviction of several druggists who had violated the law. Several witnesses were called upon to testify as to the circumstances attending the sale of intoxicants. The county attorney put the following questions:

"You say you bought this liquor for medicinal purposes?"

"I did."

"You bought three bottles of beer on such a date?"

"Yes, sir."

"State to the court and jury the particular disease that required three bottles of beer as a medicine."

"General debility."

The next witness testified to having bought half a pint of whisky at the same store.

"And what was your disease?" asked the attorney.

"General debility."

A third witness swore that he had bought at the same place a pint of brandy.

"State to the court the particular malady that required the taking of a pint of brandy," said the prosecuting lawyer.

"General debility," replied the witness.

A titter went around the courtroom, and the county attorney, facing the jury, said gravely: 'Gentlemen of the jury, this is the first time I ever knew that 'general debility' was an epidemic and that either beer, whisky or brandy was an infallible remedy!"

The jury brought in a verdict of guilty without leaving their seats.—*W. J. Press.*

—Good clerks cannot counteract the effect of poor advertising, but good advertising sometimes makes up for poor clerks. —*Exchange.*

THE METAL WORKER

PATTERN BOOK.

SEVENTH EDITION.

This is a handsome volume of 242 pages, printed on heavy paper, and substantially bound in cloth. It is illustrated by upward of 520 line engravings.

The work is comprised in five general divisions or chapters, bearing the following titles: (1) Definitions and Technicalities; (2) Drawing Tools and Materials; (3) Geometrical Problems; (4) The Art and Science of Pattern Cutting, and (5) Pattern Problems. These titles sufficiently indicate the subject matter of the several parts.

The List of Problems

demonstrated is very extensive, and embraces almost everything of common occurence in the sheet-metal trades, with enough of the exceptional to show methods adapted to special requirements. This chapter, in short, is a ready reference book for all who have pattern cutting to do. Each demonstration is complete in itself. A carefully prepared index facilitates reference. The work has been prepared for sheet-metal workers in general, and not for any one class in particular. The tinner will find in it what he requires, without the necessity of studying the cornice problems. The cornice maker will find in it everything from a simple miter to the most complex problems, so arranged as to meet his requirements, without the necessity of going through portions in which he is not interested. The general student will find the entire subject presented in such a manner as will facilitate systematic study. The rapidity with which each edition has been exhausted, and the universally favorable comments it has called forth, prove that it fully meets the want it was intended to supply

ESTABLISHED 1860. BALTIMORE.

—OUR—

PENDULUM PRESSES

are suitable for a wide range of work. Grooved beds with sliding bolts for holding all sizes of dies. Perfectly fitted balanced, and adjustable to light and heavy blows. A first-class machine in every respect.

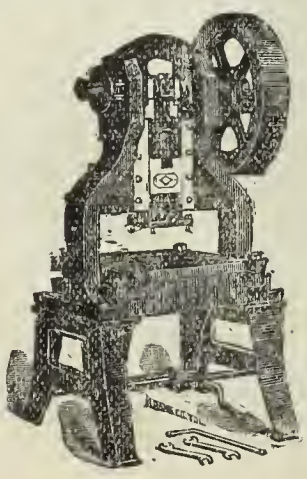
MANUFACTURED BY

G. A. Crosby & Co.,

176 & 178 So. Clinton St., CHICAGO, ILL., U. S. A.,

DESIGNERS AND BUILDERS OF

Power, Screw, Drop, Hand and Foot Presses, Squaring and Trimming Shears and Special Machinery for Can, Soap and Boiler Makers, and other lines of goods, including **Lanterns, Oil and Vapor Stoves, Locks, Hinges, Wire Goods, Brass Goods and all Hardware Novelties.**



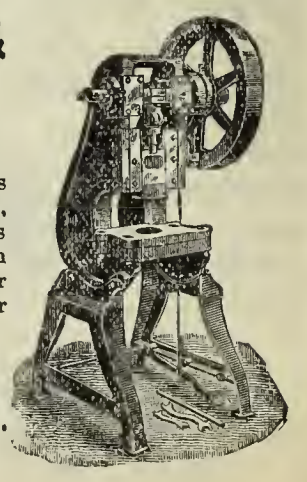
Special Attention to Dies of every Description.

WORK GUARANTEED THE BEST.

Write for Prices and Our New 200-Page Catalogue.

☞ Agents for the Clark Perfection Kerosene Oil System for Heating Soldering Apparatus.

The Toledo Machine & Tool Co.,



MANUFACTURERS OF

Power Punching Presses, Drop Presses Trimming Presses, Stamping Presses, Riveting Presses, Embossing Presses Presses with Automatic Feeds, Chain Presses and Machines for working Bar and Sheet Metals. Complete outfits for Can Making.

Send for Catalogue now being Printed.

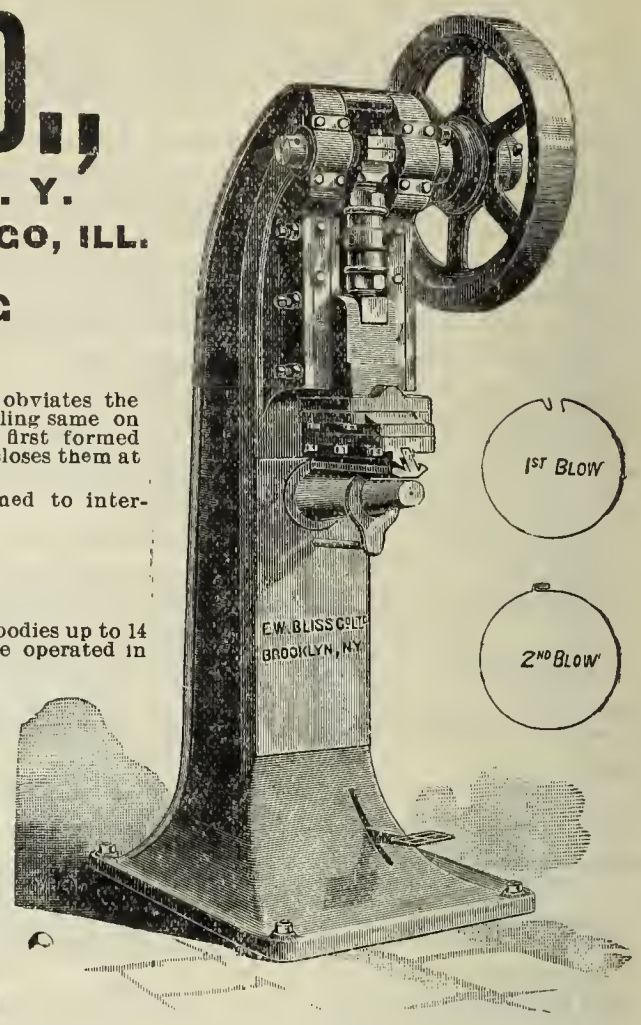
DUPLEX FOLDING AND SEAMING MACHINE.

THIS machine is designed to facilitate the manufacture of lock-seamed tinware. It obviates the necessity of using a bar-folder for forming the hooks on the body blank before rolling same on the forming machine. Its operation is exceedingly simple and reliable. The blank is first formed in the rolls, then placed in the machine, which forms the two hooks at one stroke and closes them at a second operation. The advantages obtained are:



First—That the blank is rolled in the flat, not having any hooks previously formed to interfere with the operation.

Second—That both edges are hooked at one blow.

Third—That the hook forming and closing are done in one handling.

Fourth—That the seam is more uniform than if started in the bar-folder.

The horn can be arranged to throw the seam inside or outside. All sizes of bodies up to 14 inches long can be done on the one horn. These horns and forces are not adapted to be operated in presses having more than ½ inch throw.

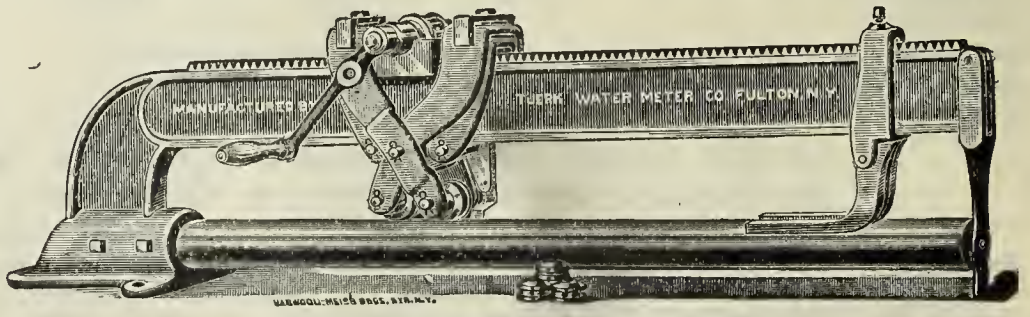
GEO. A. OHL & CO.,

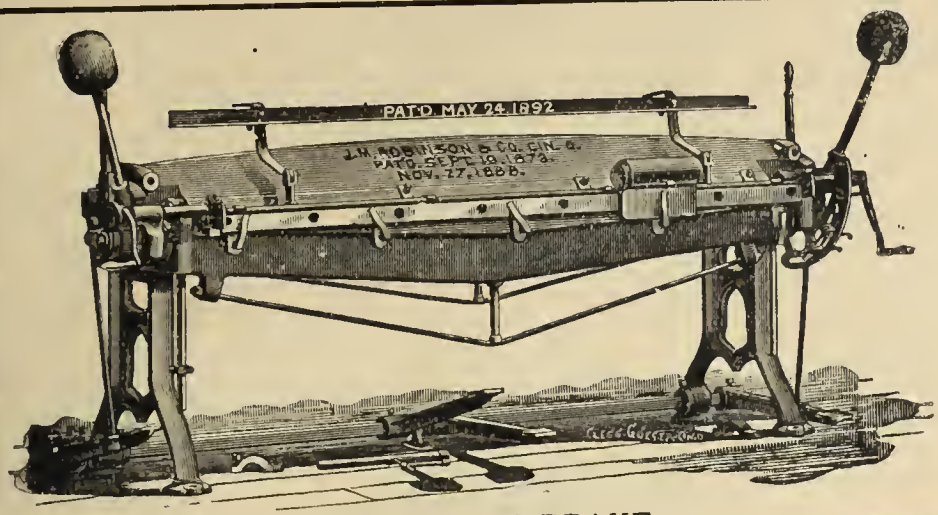
Successors to the Calvin Carr Cornice Machine Co.,

157, 159, 161 Oraton St., Newark, N. J.,



Are manufacturing three different kinds of brakes—the well-known Automatic Brake, the improved Double Cam Brake and a Hand Lever Brake. This meets the demand of the trade in every respect, and on account of low prices is in reach of every cornice maker.

PATENTED AUTOMATIC BRAKE.

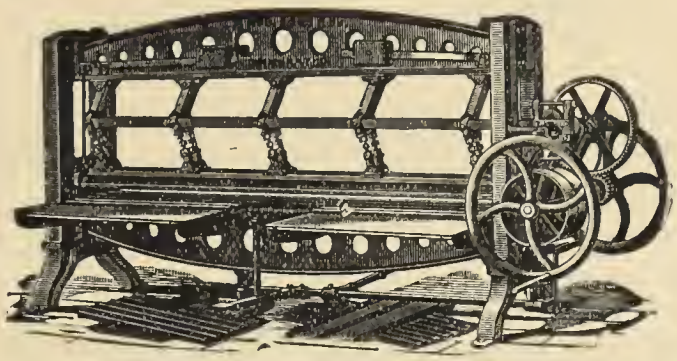


We also manufacture Circular Machines, Squaring Shears, Slip Rolls, Drop Presses, Shears and Punches, Scroll Shears, Brace and Wire Benders, and all machinery used by sheet-metal workers. Special attention called to our improved Hammering Machines, patented December 27th, 1892 Send for our illustrated catalogue.

TUERK WATER METER CO.'S GROOVER.

SEND FOR CIRCULAR.

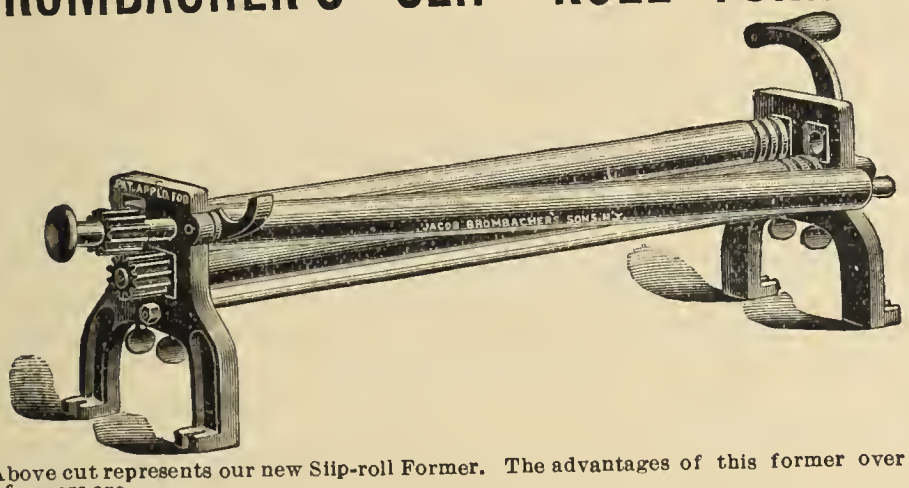
Manufactured by **TUERK WATER METER CO., Fulton, N. Y.**



THE "GLOBE" CORNICE BRAKE.

With which to form Sheet Metal into Cornice Mouldings, Ridge Caps, Skylight Bars; and with Beader and Gutter Former attached to Brake (price of which is extra), Bead and Form Gutters. Cornice manufacturers' Steel Straight Edges, 30 inch to 10 foot lengths.

ROOFING MACHINE.



With Dies suitable, will form Sheet Metal Roofing, Siding, Ceiling, Weather-Boarding, Skylight Bars, Metal Lathing, Gutters, Ridge Caps, Escalloped Steel Sheets and Cattle Troughs.

J. M. Robinson & Co., Mfrs.,

225-229 W. Second St., Cincinnati, Ohio, U. S. A.

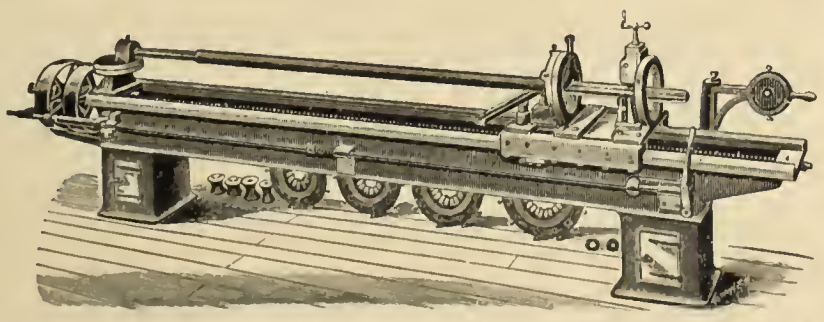
BROMBACHER'S SLIP ROLL FORMER.

Above cut represents our new Slip-roll Former. The advantages of this former over ordinary formers are

First, that the rollers are made of cold rolled steel rolls.

Second, it has cut gears with consequent smoothness of operation.

Third, the thumb screws are inserted from underneath, consequently the box carrying the rollers rests on the screws instead of the screws carrying the boxes and rollers; this obviates the possibility of breaking thumb screws.



Fourth, we do not have to split one frame in order to obtain the slip-roll mechanism, and we therefore have all the rigidity of ordinary formers with all the convenience of slip-roll formers.

Above design makes the smoothest and quickest operating and stiffest Former on the market and they are sold at the price of ordinary Stove Pipe Formers.

JACOB BROMBACHER'S SONS - - No. 30 Cliff St., N. Y. City.

Established 1833 Incorporated 1887.

Ten foot Corrugated and Plain Round Conductor Pipe, Square Corrugated Conductor Pipe, and Ridge Roll Machine.

Also New and Improved Machinery for Manufacturing Metal Roofing.

The Metal Worker Essays on House Heatin by Steam, Hot Water and Hot Air.

WITH INTRODUCTION AND TABULAR COMPARISONS.

Second edition, revised. To which has been added a selection fr the Letters of Criticism on the Essays as originally published in T METAL WORKER and a chapter on Proportioning Radiating Surfaces.

How to Effectively and Economically Heat a Given Building

is a problem of the highest importance to the Architect, Builder and Owner. Shall stea water or air be employed as a medium? What are the relative merits of the differe systems? By what means can a comparison be instituted that will show their respecti advantages?

The essays comprised in this volume are some of the results of a prize contest conduct by *The Metal Worker* some time since. They include the prize essays and selections fr the best of the others. The foundation of all the essays is a house, the floor plans a elevations of which were the result of previous competitions conducted by *Carpentry a Building*. The elevations and the plans of this house were carefully printed on separa sheets adapted to receive at the contestants' hands lines indicating the position of heat runs of pipes, location of radiators, etc., thus insuring a uniformity in presentation, a also holding the competitors to exactly the same conditions. The result, therefore, i book in which are shown: First, different means of heating the same house, among whi may be instituted various comparisons, and, second, several different interpretations each of the several methods, among which also instructive comparisons may be institute

The work is not a mere theoretical consideration of principles and a statement of fa gained by inquiry in the trade; but, instead, a collection of essays by practical men, ea showing how one man would go about heating the building in question, using the mea with which he is best acquainted in practice. Features of the book which are not the les important among its numerous merits are the *lists of items and statement of cost* a companying the different essays. Never before in the history of the heating trades has the been offered such a collection of information directly from the practice of those who a actively engaged in the heating business as is contained in this volume.

"The whole forms a valuable and instructive exposition of current practice house heating."—*American Machinist.*

"Covers the ground very completely."—*Scientific American.*

"It will be found as complete a compendium as possible of existing informatio on this subject, amply illustrated by drawings."—*The Sanitary Era.*

JAMES SQUIRE, *Youngstown, Ohio.*—"If we only had the information contain in this volume in earlier life, we could now have dollars where we only ha buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth One volume. Price, $3.00.

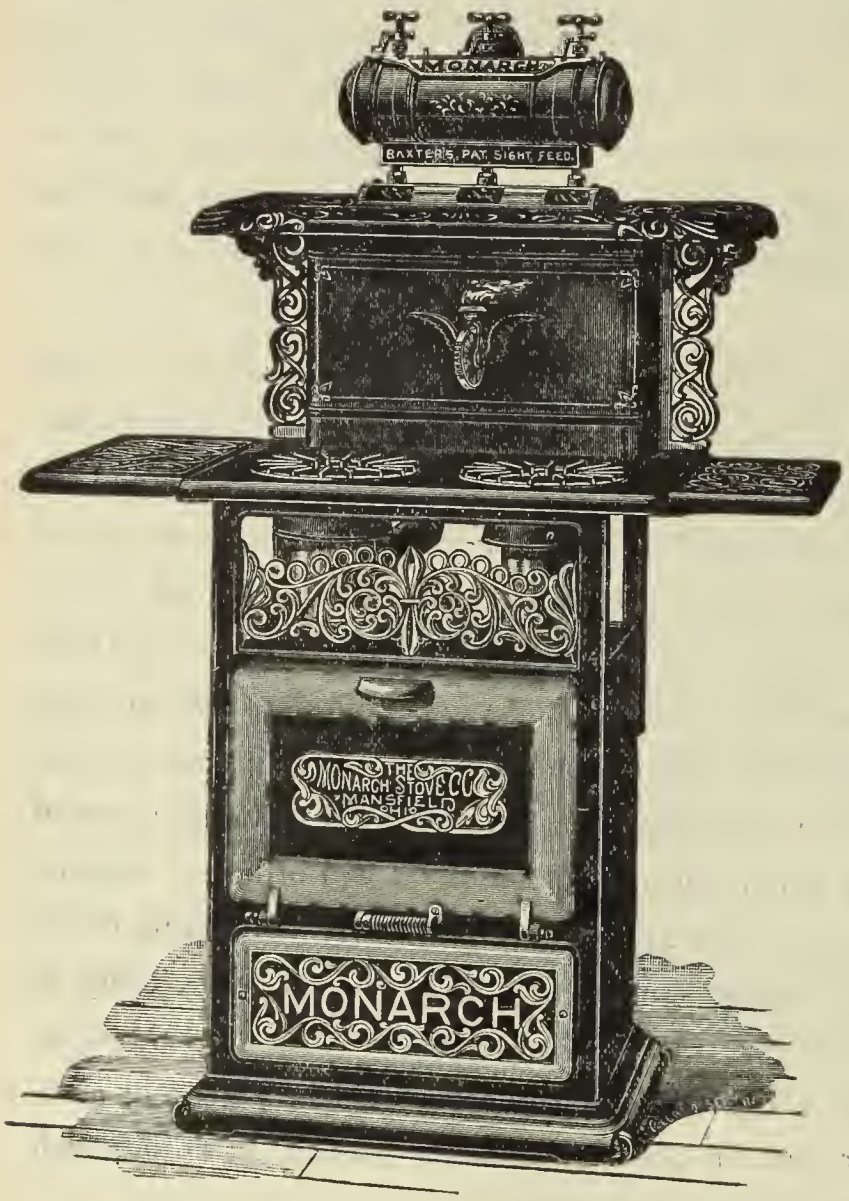
Kellogg & Stokes, 1408 Wynkoop St., Denver, Colorado.
Hoffman & Weller, Los Angeles, Cal.
Milton Rogers & Sons, Omaha, Neb.

Important Notice!

All dealers in and users of vapor stoves are hereby warned that **THE STANDARD LIGHTING COMPANY,** of Cleveland, Ohio, and its duly authorized licensees have the exclusive right to make, use and sell vapor stoves employing the evaporating principle as embraced in the several patents granted Charles M. Hollingsworth, Rudolph Flick and Zebulon Davis relating to Process and Apparatus for Vaporizing Liquid Hydrocarbons and to Improvements in Vapor Stoves, and that all who purchase, use, sell or offer for sale stoves embracing said inventions, or any of them, made by others than The Standard Lighting Company, or its authorized licensees, are liable to prosecution, as well as the manufacturers of such stoves.

Having been lately informed that a Vapor Stove was being manufactured and offered for sale in Milwaukee, Wisconsin, which infringed the Hollingsworth patents No 420,797, No. 421,834 and No. 470,756, and the Flick patent No. 483,051, The Standard Lighting Company has commenced suit against the manufacturers for infringement of these patents and is now prosecuting that suit in the Circuit Court of the United States for the Eastern District of Wisconsin. It has also brought suit for infringement of these patents in other districts against dealers who are advertising such stoves or offering them for sale, and hereby notifies all who may either sell or offer for sale infringing stoves that they, as well as the manufacturers, will be held responsible therefor. For the purpose of protecting its licensees, as well as itself against all infringements, it will bring suit against others who sell, offer for sale or use such inventions, or vapor stoves containing them, without authority from it, so far as may be necessary to fully assert its exclusive rights in respect thereto; and it requests all who may know of any sale or offer for sale of infringing stoves to promptly notify it of the name and residence of the person or company selling them, or offering them for sale, in order that it may proceed to enjoin such infringers and to recover such damages as may accrue thereby.



The following are the only authorized manufacturers of these inventions, to wit.:

THE STANDARD LIGHTING COMPANY, CLEVELAND, OHIO,
THE DANGLER STOVE & MFG. COMPANY, CLEVELAND, OHIO,
THE SCHNEIDER & TRENKAMP COMPANY, CLEVELAND, OHIO,
THE AURORA VAPOR STOVE COMPANY, CLEVELAND, OHIO,
THE QUICK MEAL STOVE COMPANY, ST. LOUIS, MO.,
JOHNSON & BRANDON, ST LOUIS, MO.,
GEO. M. CLARK & CO., CHICAGO, ILL.,
THE MONARCH STOVE COMPANY, MANSFIELD, OHIO

The Standard Lighting Company,

CLEVELAND, OHIO.

Throughout the year of Ninety-five
The MONARCH STOVE COMPANY will be alive;
And Dealers who 'gainst hard times strive
With MONARCH STOVES will see trade revive.

Our Spring Poet may be off color, but he sings truthfully. The new Catalog is now ready and it's a Hummer.

Yours for the asking.

A postal card will tell us you want one, and will be tickled to death to send it.

DEALERS!

All Weak Points About Vapor Stoves

are not called to your attention by unscrupulous manufacturers or their salesmen. They often palm off imperfect and faulty stoves as perfect, and jolly you into the belief that you have struck a bargain.

But when summer comes and truth comes to light, as it invariably does in the vapor stove business, vexation and disappointment come with it. Vexation, because you have been duped, disappointment, on account of the loss of a season's profit.

Better handle a *good line* at a fair profit than a *poor* line at a *bargain* profit. There is no such thing as a "bargain," especially in the vapor stove business. *Proof*—Review the past???

Better buy from a responsible manufacturer or his legitimate jobber, especially of one whose integrity is unquestioned, and one whose knowledge of the vapor stove business secures you an honest deal and prevents the imposition of fakes or shoddy goods. *There are a few of us left.*

Better buy a good line to be successful. A *bad* stove is a very poor purchase at *any* price.

Better look for Protection.

Protection in order to be of service to you must begin at home. See that this point is not overlooked when casting about for a line for 1895.

Better think this over.

The old adage reads, "Make Haste *Slowly*." This is a weighty proverb. The more so when you consider that the best versed manufacturers in the vapor stove industry are not offering any new inventions or innovations for the coming season.

Yours respectfully,

THE SCHNEIDER & TRENKAMP CO.,

479-501 Case Ave., Cleveland, O. 67-69 Lake St., Chicago, Ill.

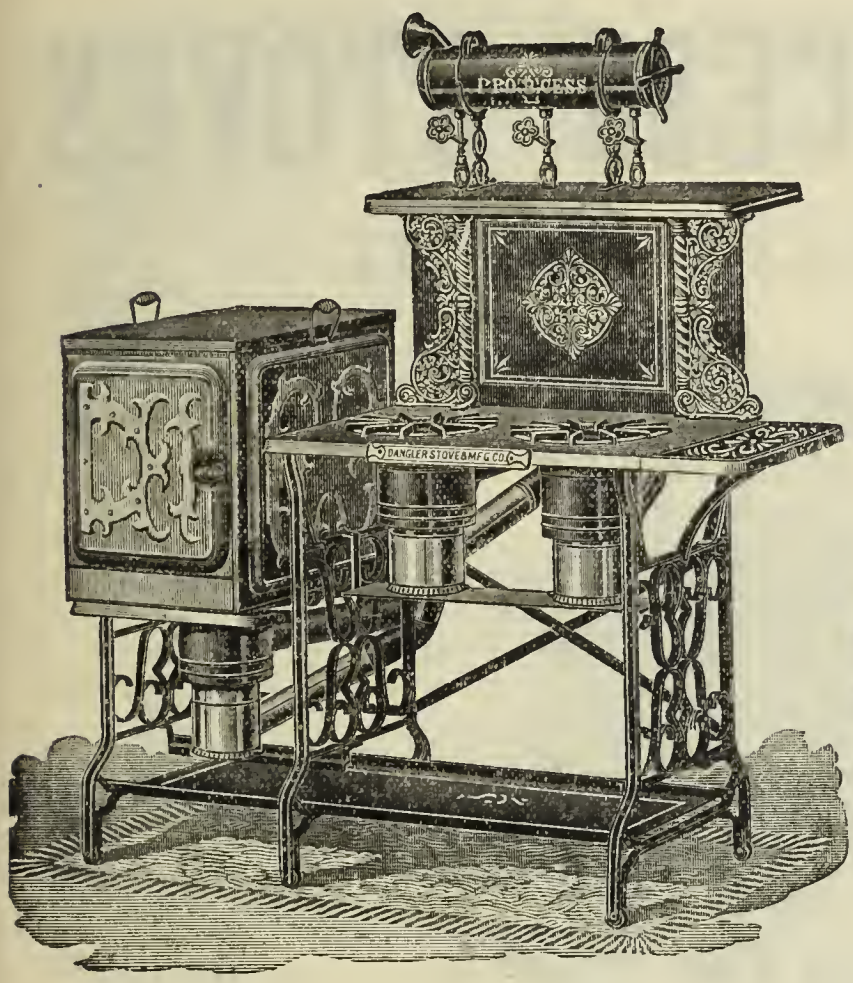
IMPORTANT ANNOUNCEMENT.

To Our Patrons and the Trade Generally:

Our new Catalogue for 1895 will be ready for distribution within a few weeks. We take this means of announcing in advance of its publication that we have very carefully studied the requirements of the trade in every particular, and that our lines will be complete. We will place on the market specialties in entirely new goods that will commend themselves both by reason of popular prices and their many attractive and desirable features. In addition to our very popular Oilgas Cook Stoves, containing our improved 1895 Burners that are giving such perfect satisfaction, we have something entirely new in the line of special Lamp Stoves at special prices; also Sheet Steel Circular Burner Oil Cook Stoves. Write for further information and prices.



CENTRAL OILGAS STOVE COMPANY,

—Manufacturers of—

Gas, Oil and Oil Vaporizing Stoves and Fixtures. Over 200 different styles and sizes for Cooking and Heating purposes.

BOSTON, NEW YORK, CHICAGO, SAN FRANCISCO.

Facts of Interest to the Public.

Our "PROCESS" for 1895, we can say unqualifiedly, is the

MOST PERFECT WORKING

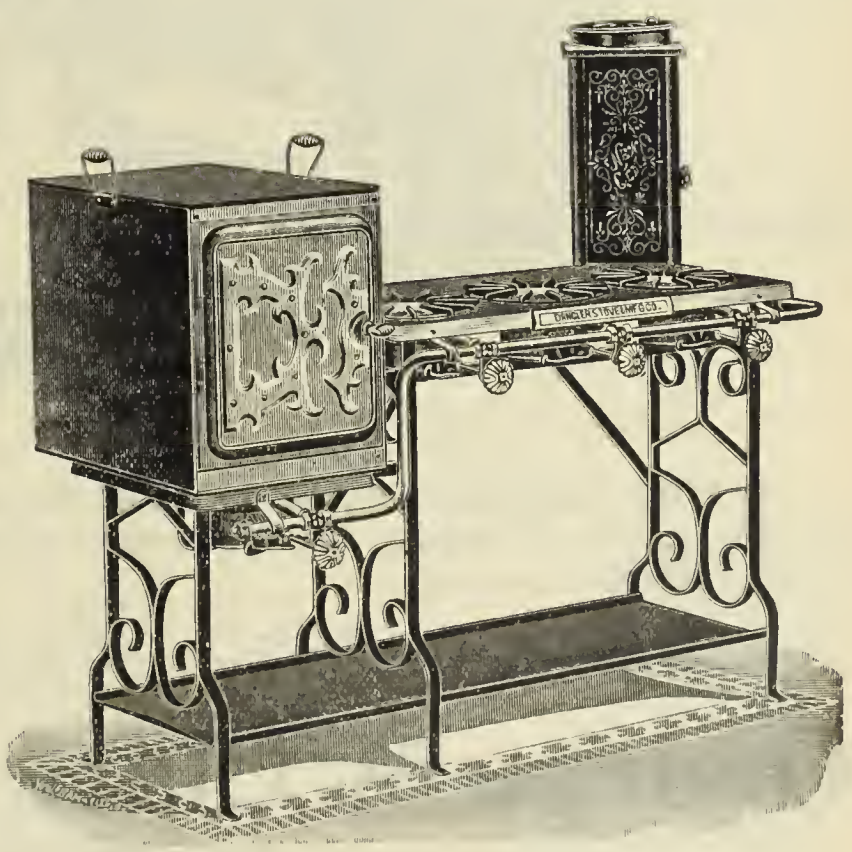
PROCESS STOVE EVER PLACED ON THE MARKET, and HAS NO EQUAL.

In calling attention to our

NEW GEM STOVE,

We offer the trade a STOVE FOR THE PEOPLE and FOR THE TIMES.

THE GEM STOVE is CONVENIENT



in SIZE, with the same sized flame as the PROCESS doing the same amount of work with **less fuel**, and at an original cost of only about ONE-HALF that of the regular high Stoves. This Stove is ABSOLUTELY our own, and CAN BE MADE ONLY BY US, and as pioneers in this business, the public naturally look to us for progress, while some of our competitors, who can only make the old line, call such improvements, "an innovation." Our GEM and PROCESS, together with our DELIGHT, celebrated JUNIORS, Individual and Single Generator Burner Stoves, &c., will give our trade a decided advantage over their competitors.

Write for Catalogue, 1895.

"CINDERELLA."

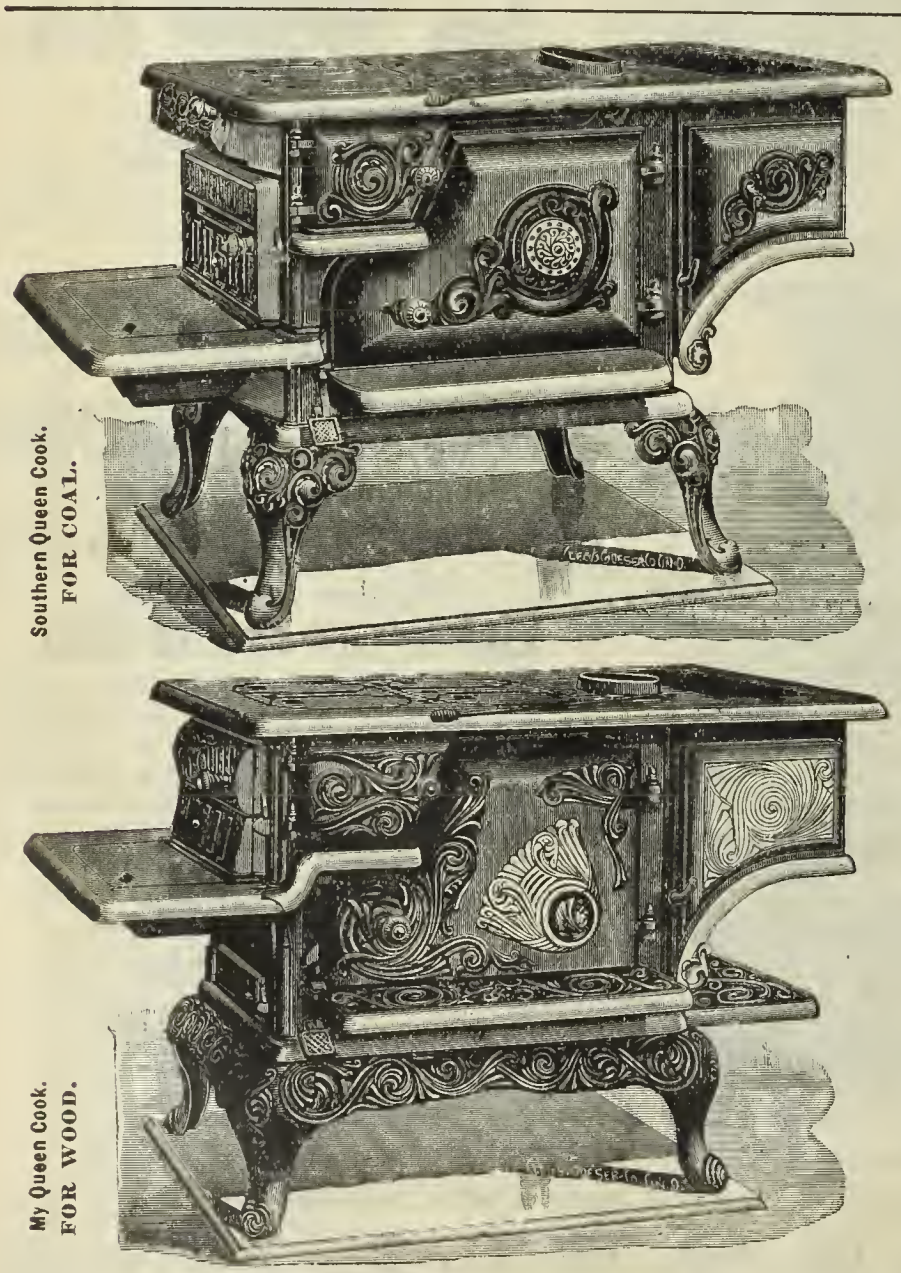
We Would be pleased to send our catalogue upon application.

DeHAVEN & CO., Limited, - - Pittsburgh, Pa.

Taplin, Rice & Company,

—Manufacturers.—

DICTATED BY P.



Akron, Ohio, January 29, 1895.

BY THIS we beg to call the attention of the trade to the fact that during the current year we will be on the market with several new patterns of Steel Ranges and Heating Stoves, of superior construction, ornamentation and attractive form, the patterns of which are well under way and will soon be ready for the sand. The Climax Steel Range, which will be made in all the various conventional forms and styles, will be both as to construction and appearance second to none on the market. We will also have ready for the trade in due time a "Climax Air Blast" and "Climax Air Tight" heating stove in different sizes, the constructive features of which will be a radical departure from any pattern of stove ever offered, and we feel well assured they will wherever introduced take a leading position in the line of special heaters. Cuts and prices of these Ranges and Stoves will be mailed on application at an early date, and we are confident you will feel justified in deferring your order for supplies until samples or cuts of stoves named may reach you.

With grateful appreciation of former courteous favors shown us by the trade, we remain,

Very respectfully,

TAPLIN, RICE & CO.

IT has been said that in America TWO CLASSES of Stoves and Ranges are sold, viz.:

"GARLANDS"

—AND—

OTHERS.

At the very head and front of the "Others" stands our new line of

"MICHIGAN"

Stoves and Ranges, which are unquestionably the latest, handsomest and most artistically designed Stoves and Ranges to be found upon the market at anything like the price at which they are sold.

They are made under our own supervision; by same workmen and out of the same material from which "Garlands" are made, and this fact of itself should be sufficient to cause them to be preferred by discriminating merchants and consumers, as against all other brands, excepting the invincible line of "Garlands."

— "You remember Robinson, our old schoolmate?" he asks of Mr. Carroll Johnson, on the end.

"Perfectly," says Johnson; "the old boy's doing well, I hope?"

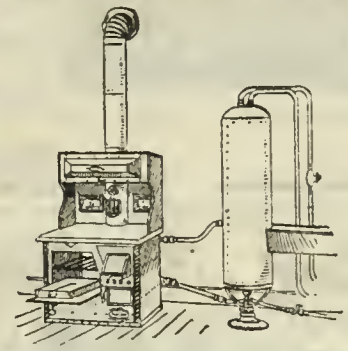
"Oh, yes; he's married, prosperous and has three children."

"All living?" asks Johnson, kindly.

"Well," says Thatcher, hesitatingly, "two are living, and one is in Brooklyn."

"That's all right," blusters Johnson. "I'm a Brooklyn man myself. And I tell you Brooklyn has something New York will never have."

"What's that?" asks Thatcher.



"The other end of the bridge."—*The Press.*

— JONES: "Heard about Smith's scheme to get a crowd to his store?"

— JEANS: "No. What is it?"

— JONES: "He advertises to perform a most astounding feat of modern magic, and when he gets the crowd he turns a peck of potatoes into a barrel.—*Printers' Ink.*"

— CONSIDERATION: "And how did your performance come off?"

"Splendidly," replied the enthusiastic amateur actor. "The ladies wore big hats and the people in private boxes interrupted nearly every scene. They treated us exactly as if we had been professionals."—*Washington Star.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

STEAM, HOT WATER AND HOT AIR

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in THE METAL WORKER and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. *Per contra*, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanatarian.*

"There are fifteen essays in all, and every one of them is well worth the careful consideration of those interested in this most important subject. . . . The work is undoubtedly one of the most practical and highly valuable ever given to the public on the subject of house heating, and so thoroughly contrasts the different systems considered as to leave the subject almost, if not completely, exhausted. We commend it to the kindly consideration of all of our readers who desire the most practical views on the subject of which it treats."—*The Age of Steel.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, etc., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*
